Announcing - Honeywell's new exhaust gas temperature indicating system

A SYSTEM that will measure exhaust gas temperature of jet engines with an accuracy of plus or minus 5°C . through the engine's entire temperature range!

That's the latest jet engine development from Honeywell - the most accurate exhaust gas temperature indicating system available today. The system weighs only 3.5 pounds.

Combining new miniaturization techniques with years of experience in producing precise, reliable controls, the new Honeywell system will give accurate indication for a minimum of 1,000 hours of operation without recalibration.

In safeguarding engine life and assuring the pilot of adequate thrust, accurate temperature indication is a must. That's why this new system, four times more accurate than any other available system, should contribute greatly to more efficient and reliable jet flight.

For additional information on this new exhaust gas temperature indicating system, write to Honeywell Aeronautical Division, Dept. AW 7-149, Minneapolis 13, Minn.

AS REVOLUTIONARY AS THE MATADOR...

KAYLOCK

SELF-LOCKING NUTS

effect major advance
in aircraft performance through
reduction in fastener weight.

NOW—over 50% weight savings!

The Martin Field Matador is the first successful nuclear bomber to be approved by the U. S. Air Force. Its exceptional simplicity, load, extreme stability and total structural innovations—the result of Kaylock Systems Engineering—has set the standard for the future.

It is estimated that Kaylock nuts save as much as 700 pounds on a typical guided missile or a fighter plane, based on the accepted weight-growth factor of two.

lightest • strongest • lowest

Check these features:

- Lightest Weight
- Highest Axial Strength
- Lowest Height
- Most Consistent Locking Torque
- Definite Reusability
- Impossible to cross-thread

Only one part required
for both 250° F and 325° F

locking nut

locking washer nut

grip element

Each nut may be

designed for any major aircraft

with other applications such as steel

and aluminum products produced by full size

machines with no tolerance specifications for 1/2 and 3/4 inch

For more detailed information on Kaylock nuts, select size, type and quantity

desired and complete data will be sent

plant with a
one-track mind...

○

Actually Twin Coach Aircraft Division is five plants—each devoted exclusively to aircraft production. We do no other work; we build no other products.

Here's why this is important. It means your aircraft assemblies are built by experienced aircraft specialists... men who know no other standards than those of the aircraft industry.

So if you have an assembly you're thinking of subcontracting, call in Twin Coach Aircraft Division for consultation. You'll be aware in the knowledge that it's back by men who think like you... men whose one thought is to produce to specification and on schedule.

TWIN COACH COMPANY

Aircraft Division

SUFIALO, N. Y.

OTHER DIVISIONS OF
TWIN COACH COMPANY MAKE:
Engel and Pinner Engines
Gardner and Pinner Engines
Engel Lighted Aircraft Engines

TWIN COACH AIRCRAFT DIVISION MAKES ASSEMBLIES FOR

DOUGLASS 312 AND 37, BOEING B-22, PLACER MAP, REPUBLIC F-42, AND CLASSIFIED EXPERIMENTAL AIRCRAFT TYPES

FOR HIGHER AE VALUES... ROEBLING LOCK-CLAD AIRCORD

Lock-Clad Aircord is preferred aircraft cable with an aluminum alloy tube around strand. The cable possesses the combined strength and safety of a multiple structure while the tubing reduces the elastic stretch inherent in cable.

Saves weight... Ideal for pressurized cabins

In addition, Lock-Clad saves weight by permitting use of smaller controls, pulleys and supporting fixtures. Sensitivity in the control system is increased by positively eliminating cable curve changes and brings easy, uniform control. Its smooth surface fits perfectly through pressurized cabin stuffing boxes.

Engineering Service

Contact our Engineering Department for data and suggestions on complete Lock-Clad Control Cable Assemblies. John A. Roebbling Sons Corporation, Trenton 2, New Jersey.

ROEBLING

Subsidiary of the Colson-Peel and Sons Corporation

11 PRIME MANUFACTURERS
Specify THIS NUT
for integral fuel tank sealing
on aircraft in production

FEATURES

- * High pressure sealing without using compounds
- * Incomparably self-contained assembly
- * Simple point seal
- * Floating seal with stationary seal, unaffected by
- * removable tank insulation
- * Reduces installation time weight and maintenance

SPECIFICATIONS

Self sealing nut conforms to applicable requirements of MIL-9-6155
AN-35. Flare: 625 in. all diameters

REPLACEMENT type seal conforms to requirements of MIL-9-6155
for aircraft high Type 1, 2 and 3. It is also resistant to air,
oil, water, acid, gasoline and most organic solvents. Temperature
range: -107°F to +232°F continuous operation. Pressure
range: -58 in. vacuum to 100 psi, continuous operation.

SEALCON type seal. Resistant to high acid, alkaline, synthetic
oil. Temp. range: -107°F to +232°F continuous operation.

The range of available seal sizes now available has
been greatly expanded. Pick the part number that
meets your specific requirements from the following
chart of identification types.

Thread Size	Seal Size	Seal Size	Seal Size	Seal Size

A REAL SPACE SAVER!

ADVANCE TO MINIATURE RELAY

Only 14 sq. inches in size, yet it carries 5-amp. loads in the 40°C. environment. It's available up to 40°C. and with extra "H" modification.

It's more efficient, too, having only one sq. in. p.p.m. the maximum sensitivity. Its open-holding the common rapidly in place, and using cross-bar contacts, all adjustment problems are eliminated. Inexpensive in comparison, because there is no grinding or bolting.

The ADVANCE TS telephone type operates on 50 milliwatts or less. With 100 mW (100 CFS) Ambient temperature range: -55°C to +125°C. Life expectancy: 1,000,000 cycles with most bar contacts. Digits and mechanically sealed types. Write for details.

ADVANCE ELECTRIC AND RELAY CO.

AF to Increase New Orders for Aircraft

- \$1 billion to be obligated within next four months.
- Big chunk to go for new NAA F-100 contracts.

By G. J. McAllister

Air Force will accelerate its obligation rate sharply during the first four months of fiscal 1955 after spending only \$1.7 billion net obligations in fiscal 1954.

This will be reflected in the monthly industry by an increase in the number of firm contracts for aircraft purchases previously planned by USAF.

Roger Lewis, Assistant Air Force Secretary for Material, says:

- \$1 billion from funds for 1954 and prior years will be obligated in the next four months, "a big chunk" of it for North American F-100s. Approximately 75% of fiscal 1954 procurement funds will be obligated by October. Fiscal 1953 procurement funds are currently more than 90% obligated. A total of \$5.2 billion was available for 1954.

- About 35% of the total acquisition rate fiscal 1955 of \$4.49 billion was not obligated because of what Lewis terms "loss life delays" in the program—currently under review (17-192) and the withdrawal of requirements (34-595).
- Gross obligations for 1954 were \$5.7 billion, but \$2 billion was canceled.

Major reason for non-obligation in fiscal 1954, Lewis says, was USAF's "forward purchasing policy." (Aviation Week Feb. 15, p. 15), the reduced lead time on re-orders of planes already in production that accounted for 37% of the funds not obligated. This "simple" policy of not placing an order before it was necessary to place an order," he says.

- Increased flexibility—"We didn't make these re-order plans automatic," Lewis reports. "We went into the factories and got back from each of them for each model what they thought the re-order time should be and we placed orders on that basis." Lewis told a news conference.

"The adoption of a policy of timing the placement of orders to the re-order lead requirements stated by the manufacturers has made it possible to defer the actual obligation in a number of cases. This has the effect of putting

ESTIMATED UNOBLIGATED coverage in aircraft and related procurement approximately from fiscal 1954.

our orders on a more current basis, giving us more flexibility to accept in gathering changes and a greater ability to schedule our buying throughout the year.

"Production stoppages reflected on our schedules have made it possible to defer some follow-on orders. This has encouraged better performance on the part of manufacturers."

Re-order lead time on aircraft, Lewis reports, has been reduced from 21 to 15 months.

- **Spares Policy**—Another reason, accounting for 25.5% of the net obligations in fiscal 1954, was "elimination of spares—the process of determining precise spare requirements."

ROGER LEWIS: Orders when necessary.

DISTRIBUTION of 54-493 billion available procurement funds for fiscal 1955 on aircraft and related procurement.

"These are the spares that you order automatically with the original airplane, and not the reserve inventory spares," Lewis explains. "Back in the days when we were not paroled—we got into a machine—and it was a good machine—of being (overheated). Look, you're going to get so much money for spares and when you find out exactly what you need and can place it, let us know and we'll go ahead."

"When we looked at this spare business last year we found that we had spare going back a couple of years and there was no reason for them not being delivered. So we said 'If you can't show you need this money, if you haven't got your old machine cleaned up, before we give you big commitments we're going to stop the money and start on a cleanup of old spare orders.'"

"That has been done and this money is now in the process of being allowed."

On one new contract we let a certain percentage go for the low-range material program. We protected the current delivery element, but we did make them clean up the old business."

- **Cancellation**—Contracts, negotiated but not signed accounted for the 12.8% balance of non-obligated funds in 1954. Damaging the cancellation of \$2 billion in obligations, Lewis says 40% of the net change in expense, principally General Electric's J47 (Aviation Week Sept. 28, 1951, p. 140).

Other items involved in the cancellation program were termination of the Beech T-35 program, a substantial reduction in the size of the heavy prop-

CUMULATIVE OBLIGATIONS during fiscal 1954 for aircraft and related procurement

program and completion of contracts for 151 Boeing B-47s.

► **Slower Pattern**—The slower rate of obligations reflected by the total obligation picture as of the end of the fiscal year is, in general, the result of our efforts through the year to return to sounder procurement practices, both in our methods of contracting and the timing of our order placements," Lewis says.

"The tightening of procedures was accomplished while our buying operations proceeded according to plan. Throughout the year contractors in construction were under a moratorium and at a time that has raised the construction of production to fulfill the requirements of the 157-wing Air Force and to put into production the new equipment necessary to keep the Air Force modern."

Emphasis has been placed on an effort to write firm contracts and to discourage the use of letters of intent, the Assistant Secretary says. "An effort was also made to get previous contracts in order before new contracts were issued in the same form. The result has been that while such an obligation takes a little longer to complete, it is a far more satisfactory time both to the Air Force and to the contractor."

► **Peak Receipts**—Lewis says the aircraft industry has not suffered any benefits because of the obligation rate of follow-on orders.

"There is gradually being left a slight shortage, particularly in the subsonic tractor level, as a result of the planned turn-down over the next two years of the aircraft program," he reports. "We are now receiving replacement of about one peak rate and we will do that as our 157-wing inventory fills up. But at some time—and we think it's about two and a half years from now—that inven-

tory rate will have to shrink to a non-deviation rate, the rate necessary to improve the quality of the Air Force aircraft as new planes can be developed."

"The outstanding rate looks to us as if it's going to be about half of the inventory rate."

Lewis points out that the question of the aircraft modernization rate is out of the hands of government personnel. "It's a technical and scientific capability problem," he says.

Unobligated funds carried over into fiscal 1955 will be used as follows:

- For applications in fiscal 1955 program, \$1,645 billion.
- For completion of fiscal 1954 and prior year programs, \$2,845 billion.
- Lewis says contractor funds of \$3,645 billion against the total for new appropriations by at least that amount. Congress recently appropriated \$2,750 billion for aircraft and related procurement for fiscal 1955, the amount requested by USAF (Aircraft Week Feb. 5, p. 35).
- He says the \$1,645-billion carryover will not offset the fiscal 1956 appropriation request since all of it will be used within fiscal 1955.

Committee Approves AF Building Projects

The \$534-million Air Force construction program approved by House Appropriations Committee for fiscal 1955 provides for the Air Force Academy, new strategic and tactical air bases and more than 375 million for expansion of two of USAF's major command and development centers—Arnold Engineering Development Center, Tama, and Edwards AFB, Calif.

The program is \$111 million less than

USAF's request of \$645 million. The committee provided only \$494 million in new money, stating that the balance of the program could be financed from the \$1.2 billion in unobligated funds USAF has on hand.

► **Air Academy Cost**—The fiscal 1955 construction program approved for Army and Navy were only less than of USAF's program. Army, \$391 million; Navy, \$196 million.

The two largest items in the military construction program are \$143 million for USAF's aircraft control and warning system and \$65 million for Army's counterattack tactical defense system, primarily Nike sites.

The committee voted \$85.5 million for low-cost construction of the USAF Academy, substantially less than the \$16 million USAF requested.

► **AFB Money**—New bonds provided for are:

- **Clinton-Sherman Airport**, Okla., \$50 million. Air Command, \$1.6 million. Total cost will be \$51.6 million.
- **Myrtle Beach Municipal Airport**, S. C., Tactical Air Command, \$11.6 million. Total cost \$13.6 million.
- **Sevier Johnson AFB**, N. C., Tactical Air Command, \$13.4 million. Total cost \$17.8 million.
- **Brockport**, S. C., Marine Air Station, for headquarters for the Third Air Wing, \$11.1 million. Total cost \$52.1 million. Headquarters for other two Marine Corps wings are at Ft. Tocco, Calif., and Cherry Point, N. C.
- **\$10-million Projects**—Other major USAF projects, for which more than \$50 million is provided:
- **Arnold Engineering Development Center**, Air Research and Development Command, \$48.7 million. Of the \$175 million total estimated cost, \$179 million already has been appropriated.
- **Edwards AFB**, Calif., \$16 million. Of the \$115 million total estimated cost, \$56 million already has been appropriated.
- **Rehoboth AFB**, Cal., Air Materiel Command, \$14.6 million for inventory area facilities to accommodate large aircraft—B-36, B-57, and C-124.
- **Wallops AFB**, Texas, SAC, \$174 million for facilities to accommodate an additional wing under the 157-wing program.
- **Alton AFB**, Okla., SAC, \$157 million.
- **Hammond AFB**, Ill., SAC, \$132 million.
- **Greeneville AFB**, Mo., SAC, \$115 million.
- **1-4th Rock AFB**, Ark., SAC, \$11.9 million.
- **1-4th Rock AFB**, Ark., SAC, \$11.9 million.
- **Flushing AFB**, N. Y., SAC, \$16.8 million.
- **Patrick AFB**, N. H., SAC, \$11.6 million.

WING FLAPS IN LANDING POSITION, lightly painted Boeing 707 jet transport heads south for Boeing Field, Seattle.

FIRST U.S. JET TRANSPORT LANDING at Seattle when company is putting it through an intensive flight test program.

Boeing 707 Starts Flight Test Program

By David Anderson

Seattle-Boeing Airplane Co.'s big 707 jet tanker-transport prototype climbed steeply off the runway at Renton Airport in a dramatic start of its first flight July 13.

One hour and 26 minutes later, pilot A. M. (Tex) Johnston and copilot R. L.

(Doc) Lorch brought the yellow-and-lacquer craft in for a routine landing at nearby Boeing Field before a crowd of onlookers headed by president William M. Allen.

Johnston's comments: "... beautiful flight, beautiful airplane... handling characteristics are very good." • 27,000 ft.—Two days later, the tanker-

transport took off on its second test flight, staying aloft for two hours and 19 minutes and reaching an altitude of 27,000 ft.

On the third flight July 19, the plane touched "aggressive speeds and attitudes" during a check of emergency procedures that lasted two hours 39 minutes. Emergency procedures also

1. AIRBORNE after wing tests, the 2,100 lb. of Renton's 5,400 ft. runway, Boeing 707 starts to gain altitude quickly.

New Boeing Jet Climbs Fast On First Takeoff

2. STEEP CLIMB is aided by power of four 18,000-hp thrust PW-7A JT3-Ls (870).

3. LEAVING RENTON after its first takeoff, 707 prototype gets up to 700-ft. altitude as it passes the end of the runway.

were checked on the fourth flight July 20 at one hour 49 minutes.

►Delayed Flight—Originally scheduled for early morning, the 707's first flight was delayed until the afternoon by a heavy rain and low descent.

By 1:55 p.m., the big plane had been parked along the runway for preflight check and servicing. Johnston and Lorch arrived just before they climbed

into the lower baggage door, Allen watched them back.

"You haven't a thing to worry about, Tex," Johnston said. And apparently he did not, because the flight was successful.

Along with every other Boeing official—on delighted with the informal comments during the flight.

►IT-See "Takeoff—Final flight" cockpit

check, engine starting and taking out took about 10 minutes, the 707 lifted off the runway at 2:14 p.m., after a 17 sec. rollout run that used less than 2,100 ft. of the runway. There was about 700 ft. under the plane as it passed over the end of the 5,400-ft. flight strip.

First reaction from the crew came slowly after the start of climb. "Every-

Slick Anti-Trust Suit To Get New Hearing

Slick Airways' \$30 million antitrust conspiracy suit against American, United, and Trans World Airlines is again before after four years' delay due to legal jurisdictional disputes.

Airline attorneys are expected to continue taking depositions for almost an other year.

The case temporarily is set to come up before the U. S. District Court, Trenton, N. J., in October 1959.

► **Trip: Payment-Slick's** suit claims damages of \$10 million against the three airlines and their "agent," Air Corp. Inc., and tries for "reimbursement" for the payment be received.

Declaring that 300 sets of 544 shares of Air Corp. are owned by American, UAL and TWA, the suit charges that the companies' policies "have been

dominated and directed" by the three airlines.

The three airline defendants first had sought to have jurisdiction over the case assigned to Civil Action No. 10,000.

The district judge is so ruled that an anti-trust proceeding was a matter of law, rather than regulatory agency jurisdiction. The U. S. Court of Appeals for the Second District upheld this decision.

Last October, the U. S. Supreme Court declined to hear the case, paving the way for a damages court case to be introduced before the Trenton district court.

► **Three Suits—The** suit alleges that the defendant airlines "conspired to monopolize, monopolize and attempt to monopolize interstate air transportation" and "conspired to restrain trade or commerce in these areas."

► **By a "deliberate attempt through predatory rate policies and a program of collusion to create the monopoly of Slick's and other freight carriers and to cause them to operate at a substantial loss."**

► **By a "deliberate attempt through predatory rate policies and a program of collusion to create the monopoly of Slick's and other freight carriers and to cause them to operate at a substantial loss."**

The suit charges American, UAL, and TWA with an "organized, rehearsed and well-planned" conspiracy "before CAB," "conspiring first to block the issuance of a certificate (to Slick), if possible to do so, and second to delay it for the greatest possible length of time—well knowing that the company would substantially increase Slick's ability to withstand (their) predatory rate practices and reduce competitive practices."

► **By a "conspiracy of unfair competitive practices" designed to appropriate Slick's freight business.**

Russian Jets, Copters Buzz Spectators

Swarming Russian jet fighters (below) and seven LAH helicopter (left) fly close over the heads of Russian spectators during the annual summer day celebration at Vostochny Airport near Moscow last May. Pilots were detained only recently by the United States government agency, Soviet.

The jets appear to be MIG-15 single-seaters. None are visible as they fly a loose tight formation. In the original print they appear to be only a few hundred feet over the crowd.

Seven Russian copters are visible, also at low altitude, a practice prohibited by U. S. air displays (see sidebar opposite).

That sort of the suit appeared in Aviation Week Nov. 25, 1955, p. 26. Following the September 9-10, the Russian copter incident a few black men were seen. An unidentifiable man in a suit is under the belly just behind the nose.

Foreign observers received their first view of the large Russian biplane, powered by 11,000-horsepower jet engines during the year's May Day celebration (Aviation Week May 11, p. 12).

BOAC to Buy U.S. Strato-cruisers

British airline negotiates for UAL, PAA 377s and Quantas 749 Comets to replace Comet 1s fleet.

"Nostradamus" sufficient has been decided to support the first stage—modified, tested and proven on the market we have established ourselves—the Comets will fly again."

► **Comet Failure—The** airline expects to put its 12 Comet 1s into operation as soon as they are delivered after the Royal Aeronautical Establishment at Farnborough reaches a decision on the state of the jet transport aircraft. The airline is to be placed into service with equal speed.

A BOAC source says the Comet 1s also may receive operation at the Farnborough verdict a close test and shows the turbine can be put back into operation. BOAC will dispose of the Lockheed Constellation it now is leasing.

The Strato-cruiser will be replaced in the British airline taken delivery on 15 July 1959. British Airlines.

Feeder Outlook

- Permanent certificates win approval in House.
- Senate will take action soon on similar measure.

Two developments are scheduled for the project that Congress will decide through legislation permanent certificates for local service lines in Civil Aeronautics Board.

► **The House** committee and without debate passed a measure sponsored by Rep. Carl Albert, that would require CAB to grant permanent certificates to the existing 14 local service lines in "the first quarter of 1960" and the goal of "adequately, adequate air service to the small communities in the country."

► **Sen. Pat McCarran** introduced an identical bill in the Senate (previously scheduled for action by the Interstate and Foreign Commerce Committee).

► **CAB "Window"—Recommending** that the CAB be authorized to authorize and Foreign Commerce Committee as "the window" of CAB in an opening local service lines, rather than mail carriers, to develop local traffic, and declared.

"It would be a disastrous mistake for CAB to sever this policy at the state. The traffic airlines are geared for long-haul operations and, if required to serve these small communities, would provide

only the minimum service needed." The would undoubtedly cause a serious drop in traffic and completely destroy it if that has been decided in the past few years by the local airlines."

► **"Vacuum Circle"—The** committee pointed to the "vacuum circle" under which local lines cannot operate because of the lack of the local lines' own property certification and cannot obtain permanent rights because their operations are not economic.

"One of the principal objects of this legislation is to break this cycle and encourage the development of a suitable aircraft for the local service airlines."

Other House committee points:

► **Instead of turning local service points over to airlines, the** House should create "The Board can strengthen local structures by adding new points, particularly strong financial points, by increasing or reducing points to work within."

► **Apparently attacking** CAB's refusal to consider the capital investment of Pan Am Lines in Martin 2-2 in setting the current's and rate, the committee observed that the CAB has been unable to serve.

"Where can carrier is retroactively penalized in a mail-line conference for business decisions previously taken with the knowledge of the Board, the constant danger to the future initiative of all carriers through the committee's committee among to the government. The Board has responsibilities which it must assume, but on the other hand it must allow carriers' management's sufficient amount of discretion and authority to enable them to fully develop their companies."

► **Permanent certificates** the committee decided, will enable CAB to "develop the true previously spent on periodic renewal proceedings for the local airlines in a continuing effort to strengthen their services."

Piasecki Reinforces H-21 Rotor Blades

USAF has approved a modification program for the Piasecki H-21's rotor blades and the helicopter—operated since mid-May—will go back in operation as fast as improvements can be made. A rotor hub component is being installed on the blade's trailing edge, following investigation of a cover failure at Edwards AFB "caused by vibration of the wind properties of this particular blade." Piasecki says its engineers are aware that even an H-21 blade could have the weakness, designed and tested the reinforcement.

The H-21 blade is made to Piasecki specifications by the Piasecki Corp., Torrington, Conn., Mich.

PAA Asks New Rates To Aid Air Securities

The air transport industry needs a new rate plan to help it establish public confidence in airline securities, according to Henry J. Friendly, general counsel of Pan American World Air ways.

In testimony before Civil Aeronautics Board on the trans-Atlantic fuel and rate issue, Friendly and personal policies are hampering development—partly in the international field where airlines depend on government aid.

► **Security Dilemma.** Rates of return on investment, fixed by the Board as reasonable for commercial operations, are too low and their attainment too uncertain to attract capital, he said. Friendly adds that airline securities have not moved satisfactorily in the doldrums despite the fact that the nation is enjoying the biggest boom market in its history.

PAA's casual control Robert B. Marz, Undersecretary of Commerce for Transportation, who last recently "the most free the last that is granted, the rate with a dollar to invest does not yet regard the air transport industry as a particularly desirable place for his money."

A recent report by the Aviation Securities Committee of the Investment Builders Assn. and "Terrorism" conference in the air transportation industry is at one of the lowest points that it has been since the Civil Aeronautics Act was passed in 1938" (Aviation Week July 12 p. 42).

Friendly referred to that portion of the report which said: "In recent years, the interpretation of the act appears to have taken on an increasingly restrictive character, to such a degree that, in our

opinion, the carrier financing structure requiring government financial support is not ensuring the income necessary to enable them to maintain and continue the development of air transportation to the extent and at the financial and capital required for the convenience of the U. S. the world and the national defense."

► **9th Return.**—Pan American's rate of return since the war has averaged 15%, Friendly told the Board, "well below the return of stable electric utilities where investors have nothing like the risk associated with airline stocks. In one surprise its stock is selling at only two-thirds its book value," he said.

Convent rate-making policies of the Board do not take into account present-day problems of obtaining capital, Friendly said. A new and broader approach is needed if the Board's duty to develop the air transport industry is to be fulfilled, he added.

Aircraft Builders Need Higher Profit: Yeasting

Los Angeles—The aircraft industry needs greater financial strength if it is to carry out its responsibilities as one of the largest manufacturing industries, O. Yeasting, vice president finance of Boeing, Argyle, Co.

"We are a very important segment of the national economy," the Seattle executive told the Los Angeles Society of Security Analysts last week.

To maintain their free enterprise position in the national economy, Yeasting believes aircraft manufacturers should receive a higher margin of profit on their work of finance.

Boeing realized about 2.5% on last year's business. Yeasting says, and its profit, "15% to 225%" this year due to

prices of the metals in aircraft. "Increasing Costs—The aircraft executive points out that complexity of new airplanes is increasing costs. Comparing the B-17 of World War II with the B-47 now selling out of Boeing's Wichita plant, Yeasting says:

"Where the B-17 had little electronic equipment, the B-47 has more than 1,000 tubes, each of which costs three times as much as a 25-watt vacuum tube."

Windtunnel testing was a mere \$150 by on the B-17, compared with \$400 by on the B-47.

► **Faster.** More—Electronic research and development is necessary for future growth and expansion and "more money should be available for the job," Yeasting warns.

In the best interest of the citizen and military security, it would be best if the government could prosecute fraud and strengthen for the job that has been," he says.

We have gone some way in leveling out the peaks and valleys in aviation but as effort must be made to bring about some stability. "These are not too many stars and stripes in the business," Yeasting says.

Convair to Hire 1,000 For Weapons Projects

San Diego, Calif.—Convair will add more than 1,000 engineers and technicians to its expansion program during the next year, but work on several highly restricted projects, chief executive Frank W. Park says.

Development work on the projects already is underway and hiring will start immediately, he said.

Convair will send personnel everywhere to equip cities and colleges in the United States to explain equipment opportunities to applicants.

Four hundred of the new personnel will be assigned to electronic engineers and technicians to long-range projects under development by the armed forces.

Additionally, specialists in mechanical engineering are needed.

SBA Aircraft Loans

Small Business Administration has approved four loans to small airlines and electric power firms.

They are: Road Engineering Corp., Los Angeles, electronic research and development firm, \$85,000; The Air Corp., Clanton, Ga., manufacturer of aircraft parts, \$75,000; Texas Tool & Machine Co., Ft. Worth, Tex., manufacturer of aircraft tools and parts, \$15,000; Oregon Electronic Manufacturing Co., Portland, Ore., manufacturer of electronic equipment, \$15,000.

Labels in diagram: LINER, RIGGERS MOLDED ON TIRE BEADS SEAL AGAINST RIM OF AIR, O-RING, VALVE, SPLIT WHEEL.

How Tubeless Tire for airplanes cuts weight, gives safer landings

TAKE OUT the inner tube and you do more than save weight, simplify assembly. You get a high pressure airplane tire that's safer, too. B. F. Goodrich engineers were the first to develop and produce one. The blueprint shows how they did it.

Instead of an inner tube, the B. F. Goodrich surplus "Rubber Tire" has a patented inner liner that's part of the tire itself. There is no need to add weights. No tube to go flat—no bunch up or shift during landings and take-offs. Instead of tire and tube, there's only one unit to mount. Only one unit in warehouse, too.

The patented inner liner retains air much longer than conventional tubes. Ridges molded on the inside of the tire bead prevent air loss around the rim. On two-piece wheels, a rubber O-ring seal keeps air from escaping through the joints. An special Navy blueprint now shows one new BFG airplane "Rubber Tire" does no air even when compressed flat to the rim.

The B. F. Goodrich surplus "Rubber Tire" will soon be in general use on Government transport and military aircraft. B. F. Goodrich is now speeding development for use on commercial planes, as well as other military aircraft. It's

another first in aviation that flows from B. F. Goodrich, leader in rubber research and engineering.

Other B. F. Goodrich products for aviation include wheels and liners, DeSoto, brand rubber, Pressure-Sealing Systems, Avionics, inflatable seats, fuel cells, Rimmers, accessories. The B. F. Goodrich Company, Akron, Ohio Sales, Akron, Ohio.

New Three-Blade Hartzell Props

First view of Hartzell's new three-blade propeller for light aircraft (Aviation Week Sept. 24, 1954, p. 23) shows them installed on the propeller of an Cessna 150B, two-engine, four-seat plane that recently went into production. The new Hartzell has metal blades and no full feathering

with automatic control. In addition to the Aero Commander 440 addition, they are going into the center T18. They are said to give low vibration, low noise level, quiet and add about five miles per hour in cruise speed. Price \$1,200 a set with two-blade props as exchange.

WIND TUNNEL DIAGRAM

Clifford's Wind Tunnel

The largest technical facility of its kind is expanding to meet the increasing problems of aircraft and missile heat exchangers, valves and temperature controls.

Due to the aircraft industry's attack on the thermal barrier, the heat transfer problems associated with maintaining the lubricating oil at optimum temperature become increasingly difficult. The air heating or cooling the engine, valves, turbochargers and other areas.

Meeting these problems requires a continuous program of basic research, development and testing of heat exchanger systems.

Clifford's wind tunnel, the largest, most complete installation exclusively devoted to aircraft heat exchangers, permits highly accurate simulation of service conditions.

A hot tunnel for testing air-to-air heat exchangers up to 36" in diameter has a design airflow capacity of 45,000 CFM at 70°F. Air flow may be varied over an infinite range of values and is measured by means of orifice flowmeters. Air flow may be controlled to within plus or minus one degree F.

A cold tunnel having a test section diameter of 30" has a design air flow of 24,000 CFM at 70°F. Inlet air temperatures as low as -100°F are obtained by means of refrigerating equipment of 120 tons capacity. Air in the test tunnel may be varied over an infinite range of values and is measured by orifice flowmeters. Inlet air can be controlled to within plus or minus one degree F.

A circulating system which can deliver air at 1000 pounds per square inch at 100°F to the test section of either tunnel maintains constant temperature through a 5 way valve and recirculation system. Flow is measured automatically by electronic scales incorporated in a dead weight weighing system.

A new tunnel facility which provides air at 2000°F is designed to test aluminum and stainless steel air-to-air heat exchangers. This tunnel circulates compressor bleed airflows with flows up to 100 pounds per square inch at 1000°F and 500 psi. Special turbine ring compressors are used and a gas heater with a rated capacity of 5,000,000 Btu per hour maintains bleed air temperature. Bleed air conditions can be closely simulated by a 15 hp. blowers rated at 500 CFM at 70°F and a 54" Hg. head.

A valve blow down test facility utilizes air

Air-to-air test exchanger installed in wind tunnel test section. This is one unit of an aircraft air-to-air turbine refrigeration system under test.

Cylindrical air-to-air cooler undergoing performance tests.

Laboratory ...

from the compressors at 200 psig and at flow rates of 100 L/min. Test is with the gas being cooled temperatures up to 1200°F can be developed for the testing of butterfly valves.

Liquid-to-liquid heat exchangers such as lubricating oil coolers are tested for performance with equipment capable of producing fluid flows up to 1000 pounds per minute and pressures as high as 3000 psi. Oil flows up to 500 pounds per minute at operating pressures of 500 psi and temperatures up to 300°F are available for these tests. Multiple fuel and oil storage systems permit various test fluids to be employed.

Other facilities include a controlled temperature test room measuring 37' long, 16' wide and 13 1/2' high. Temperatures from -70°F to 150°F can be maintained at wind velocities up to 60 mph.

An environmental test chamber of 27 cubic feet capacity provides a simulated range of conditions from -100°F to 250°F temperature extremes and 50-100% relative humidity. Absolute pressures can be simulated from one level to 10,000 psi.

Complete structural and metallurgical facilities are maintained and, in addition, considerable specialized equipment of a highly advanced type has been designed and built by the Clifford Company in connection with its proprietary processes and methods.

Regenerative heat exchangers and associated system designed and produced by the Clifford Company for application in military and commercial aircraft. Units, standard and air-to-air heat exchangers.

AIRCRAFT ENGINE REMANUFACTURING SERVICE SAVES YOU TIME AND MONEY

Continental's Remanufacturing Plan now saves you a lot and they guarantee, in writing, no reason for discarding an engine with Continental power. Available through 121 major distributors with dealerships practically all airports. This savings means you a new turbo-remanufactured engine—back in five hours, and with factory engine guarantees—at a low fixed cost, with virtually no down time.

Yours in the NEW Beechcraft MODEL E35

It excels in wider utility than ever before, the second Beechcraft E35, and one big reason is that it gives you four choice of power. It comes equipped with either of two outstanding engines, depending on the performance characteristics you desire. . . . The standard E35, powered, as for several years past, by the 205-hp E-185, gives you 175 mph, with the thorough dependability you expect of Continental power, for speeds up to 9 miles higher, along with higher ceiling and faster rate of climb, specify the Continental E-225. You can still obtain the cruising range of the standard power plant, when you wish, by utilizing less of the engine's output. . . . Today's fine Beechcrafts, with choice between two proven engines, are another strong reason for choosing a plane with Continental power.

Continental Motors Corporation
Aircraft Engine Division
MUSKOGEE, OKLAHOMA

but Super Beech arrived Indo-China on humanitarian flights.

The French-built aircraft has tons, tons more. Its payload of 10,000 lbs. is half that of the C-119, but the French claim it has the desirable characteristic of being able to land at all air strips in the country. It has the same type of air dropping equipment as the B-26C.

A second squadron has been selected for the end of the year.

In the meantime, the French hope to keep the B-26C and would like to have the present limit of 12 missions per day raised. As full flight develops for the Red River delta and at Hanoi in north Vietnam, a new, heavy airlift is becoming essential.

CAF, Washington, the French Air Force, claims to expect the Command's check batteries were considered so inadequate in the CAF pilots that they requested permission to handle it themselves. All they needed was four or five fighters and a couple of B-26s to fly with their B-26C airship. This request was turned down by the French command.

Considering the limited number of aircraft that this had available it perhaps was impossible for the French Air Force and the French fleet to use airships to have supported the Red River. But little was done with what they had.

An USAF document in Korea, effective this September requires a high order of maintenance and training. The French Air Force, one of the best, has the command equipment required for such an effort. This also is a five member mission primarily. French pilots believe they should have had something for the B-26C, in order to do the job instead of personnel and equipment.

French or intelligence officers do not only report that the Command's gas was not controlled. They believe some was directed in old type sound control equipment. But if the B-26C was using more gas of the air because of their need for training, Commanders in Korea, it would have been impossible to drop at low level even with the C-119's except with prohibitive losses.

At this point, the C-47's could not have operated at low level during the night. In three of the sound tracks, C-47 pilots at night were observed their propellers.

Murray to Test Air Communication Setup

NYLOK'S Self-locking THREADED INSERTS...

• For use principally in non-ferrous forgings, castings and extrusions

CUT COSTS

Because NYLOK threaded inserts eliminate re-drilling, special tapping and all the secondary operations required by other threaded inserts. With NYLOK inserts, simply drill and tap with standard tools—thus save the cost in place. They give stronger, higher fastenings which will permit fewer redesigning per application.

PROTECT PARTS

because they eliminate thread failure in expensive castings by absorbing stress and prevent thread wear and stripping.

DOUBLE LOCK

because with the resilient nylon plug, NYLOK inserts provide a smooth, positive locking torque on both internal and external threads, thus locking the insert in the casting and also securely locking the bolt once it has been threaded into the insert.

REQUIRE NO SPECIAL TOOLS

for insertion or removal. Inserts are of standard size driver. Simple maintenance in the field.

How NYLOK THREADED INSERTS WORK...

Resilient nylon plug (A) runs up heated hole in work (internal and external threads) smoothly working under threads together lock on setting and hot sets and (B). There is no drilling on thread threads, no re-drilling of existing threads. All of today's nylon is an already and holding in position. The inserts may be used and reused many times without replacing the locking device.

For complete details on how NYLOK threaded inserts work and why they are the perfect choice for your NYLOK application, write today! NYLOK Company will gladly discuss them with you at no charge!

Write on October 11, 68

raft in the establishment of a single authority to govern the railroad, at U.S. gateway points such as New York and San Francisco.

At presently constituted, Civil Aeronautics Administration and Aeronautical Radio, Inc., a private agency, both agencies function at least of these points—nothing in development of services.

► General "Test-Flight" is being made by the committee, organized under Congressional Undersecretary for Transportation Robert B. Mann, to establish an authority that could designate which of the present agencies could serve the needs of aviation and economic efficiency.

New York's port has been chosen as the "guinea pig" in the evaluation, because it is best representative of the problem. Two of the world's major international airlines, the American World Airways and Trans World Airlines, in addition to most of the foreign airlines, serve New York. Considerable air traffic also is handled. Considerable Savings in New York, Miami and San Francisco, CAA and ARA operate their own land growth for international communication. By combining these into a single agency to serve the entire industry and the public, there could be considerable savings both in money and in frequentation cost.

At New York, where the first civilian air is being made, ARA has been considering what it would cost to extend its facilities in order to support CAA's present facilities there. CAA is following the same procedure.

When both are sufficiently evolved, the committee will determine what the agency could most economically provide the necessary service.

► Commerce Policy-Area is the only unannounced telecommunications agency licensed by the Federal Communications Commission outside the government. Its subscribers and members include all of U.S. unclassified airlines and various other air carriers and aircraft operators.

Obviate is to establish an international telecommunications network with a common policy and with a single agency operating the specific international communication stations. Results could be that one system would be operated by private industry, another by the government.

Members of the post government industry committee include: CAA Administrator Fred B. Lee, chairman; Oscar Ralle, chief of the Air Cares Division of Civil Aeronautics Board's Bureau of Safety Regulation; J. S. Anderson, president of ARA; J. W. Brown, representing Transamerica Airlines and Seaboard Air Lines; William Paul Goldstone, TWA; Capt. Walter Lynch, FAA; and Air Transport Association.

Your requirements for an alloy to say they are being used in the U.S. can be met by Bridgeport. Located in 10 states, we have 2000 tons capacity.

A background of experience and skill that assures you quality in Bridgeport Aluminum

The experience and skill in metal production that mean greater efficiency and lower manufacturing costs to users of Bridgeport brass and products, are now available to users of aluminum extrusions and forgings.

Bridgeport has a 90 year reputation for quality and service and over four decades of experience in extruding metals. From this background we offer skilled technical assistance and assurance of meeting your most exacting specifications in aluminum.

For a continuing, dependable source of quality aluminum products call on Bridgeport. We have the modern production facilities, the quality-control equipment, the skilled technique and a determination to give complete service.

Contact your nearest Bridgeport district office for information about Bridgeport extrusions and forgings in terms of your products. We are prepared to give you immediate service and deliver quality materials on the schedule promised.

Full deliveries are available for those both extrusions and forgings also are designed and produced in our own completely equipped shops.

With facilities such as the large, 15,000 ton forging press, one of the largest in the country, Bridgeport can meet the most exacting demands for quality die forgings. Aluminum and magnesium extrusions heat to gauge are also produced.

BRIDGEPORT ALUMINUM

BEFORE CRASH—an impacting approach, jolted fighter downing its crew in NACA experimental seat, a cushioned seat embodying elasticity, critical design.

AFTER CRASH, seat is shown delivered, with dummy 3000 ft/sec, positively cradled, pocket formed by seat back. Shocks dissipate energy from neck joints.

NACA Tests Promise Safer Seat Design

Experimental configuration shows how to absorb heavy impact loads and provide protective pocket that cradles passenger in a crash.

By Irving Stone

Cleveland—Recent National Advisory Committee for Aeronautics' experiments with a new seat design point the way to improved passenger safety in military and commercial aircraft.

Researchers at NACA's Lewis Flight Propulsion Laboratory have developed an experimental seat configuration whose cushioning mechanism absorbs impact loads in a crash landing and which focus to form a pocket cradling the passenger for protection.

Being Tied Back Aboard—The seat studies, a natural outgrowth of NACA's crash test work, are conducted to determine it is to find out how to keep the passenger alive, rather than just determine what injuries or kills him.

Final evaluation of NACA's seat will so will include performance of the experimentally developed units under full-scale crash conditions. NACA already has set up tests to determine what results for installation of these seats for full-scale testing.

General Work Done—The experimental seats used in the studies are not considered suitable for aircraft application, because they incorporate features of construction that are necessary for research but might interfere with passenger comfort.

NACA researchers are not interested in developing the seat as a marketable item. Their aim merely is to point the way to a new approach for safety at manufacturing to permit further. The reason that NACA will have to allow enough latitude for the seat requires to incorporate the desired standards of research.

Bendix Seat—Advantage—the following advantages are seen for the NACA-developed seat configuration.

- In addition to conventional applications, use of additional places such as in-cabin seats is seen as particularly feasible for this type of aircraft, because they are easily moved, because they are made on specially prepared materials.
- Increased number of attachment points connecting new seats to floor structure increases possibility of seat being loose in a crash landing. The number of attachment points in the pockets of the new seat is far greater than conventional seat's base point at attachment.

- Weight probably will be kept within the limits established for conventional seats.

- Cost probably will not exceed that for a conventional seat, because of the relatively inexpensive materials involved.

- Safety in Seats—Aeronautical research has established that a person can with-

stand very high impact loads if their duration is short. Also, studies of no one crash landing accidents imply that those passengers who are retained in their seats suffer the lowest percentage of severe and fatal injuries.

This information suggested to NACA researchers the possibility of learning how to reduce frequency and severity of injuries in this type of accident. In the aircraft used in NACA's crash test program, researchers installed special instrumentation to gather data on forces transmitted through the harness to the passenger cabin.

In test test it was found that loads of more than 12G were imposed. For a 160 lb. passenger this would equal a force of more than 2,000 lb. on his seat belt. Such a load might break the passenger free from his seat attachments or tear the seat from its attachment to the structure. Either situation is likely to bring injury to the passenger.

Likeable Design—In other crash tests conducted by NACA, lightweight carrying devices were used. Supplied by the military, these devices have loose harness, short straps and heavy restraint similar to harness. Data of loads during crashes were obtained and three motion pictures showed dummy seat tests.

The sequences showed that a fresh-

LFE and Bendix lick the weather.

Increase Airport Revenue!

Portable precision approach radar SPAR brings you all-weather flying...increases airport revenues and local town business income. Already proven, low-cost SPAR is in quantity production.

Airport managers all over the world have been waiting for a Ground Control Approach system simple enough to be operated by one man, accurate enough to assure absolute safety regardless of weather, and inexpensive enough to fit their budgets. Laboratory for Electronics' SPAR is this GCA system.

Simple. Operator's only all-weather approach and elevation on one high-precision 8" x 10" display screen. Instrument-control unit can be operated from field or tower.

Accurate. SPAR can guide a jet fighter or Stratacruiser to within inches of the runway, regardless of weather, and within 20 feet to the point of touchdown. Incorporates all modern developments to permit operation under worst possible weather conditions.

Inexpensive. SPAR's initial cost is only 10% that of large GCA installations...much lower maintenance and operating cost. Soon pays for itself on increased landing fees, hangar rents, aircraft maintenance jobs, and concession business.

MANY PURPOSE ROTARY ACTUATORS

EMCO has developed many types of rotary actuators for leading air frame manufacturers for use in the newest jet aircraft and commercial airliners. The models shown here are typical of the many varied designs that have been produced for a wide variety of uses.

This manufacturing experience is evidence that **EMCO** is staffed and equipped to develop any type of actuator, rotary or linear, to your exact specifications designed to draw power from any source. In many cases an existing **EMCO** model can be adapted to your specifications which will speed delivery time considerably.

TYPE C-824

Type C-824 EMCO reversible actuator was developed for opening and closing an aircraft canopy. It develops 150 inch-pounds of torque at 81 R.P.M. in intermittent duty, shifting 25 volts DC. Gear ratio is 143 to 1. Weight is 6A lbs., including radio noise filter.

TYPE B-553

Type B-553 Versamen actuator, developed for use on Lockheed PVV, is hydraulically operated. Designed for continuous duty reversible operation, it is equipped with adjustable disc torque limiter and directional torque limiter on the manual operation shaft. Normal output load at 240 R.P.M. is 250 inch-pounds. Torque limiter setting is 325 inch-pounds. Weight is 22 lbs., 5 oz.

Type B-471 EMCO rotary power package combines in one small container: motor, radio noise filter, magnetic clutch and brake, main reduction gear and auxiliary gears for driving adjustable limit switches, light switches and position indicator. It has a wide variety of possible adaptations utilizing flexible shafting to drive small rotary or linear actuators singly or in multiples. Dimensions are only 7 1/2" x 6 1/2" x 2 1/2". Weight is only 3 1/2 lbs. Specifications may be varied to suit special requirements.

FLEXIBLE
UNIVERSAL
POWER PACKAGE
TYPE D-471

TYPE D-357

Type D-357 EMCO drag-out canopy actuator develops 80 inch-pounds at 258 R.P.M. operating on 28 volts DC in intermittent duty. Gear ratio is 43 to 1. Unit includes magnetic clutch and brake and radio noise filter. Stall torque is 300 inch-pounds maximum. Weight is 4 1/4 lbs.

TYPE D-374

Type D-374 EMCO canopy door actuator has dual output shafts with 175° rotation at 1 second maximum. It is equipped with adjustable limit switches, radio noise filter, magnetic clutch and brake. Output is 250 inch-pounds of torque on each shaft. Gear ratio is 440 to 1. Weight is 8 1/4 lbs.

TYPE D-465

Type D-465 Designed as a trading edge actuator for jet lighters, it has a normal peak load of 28,000 inch-pounds and a total angular travel of 30°. Speed is 475 R.P.M. with an average load of 14,000 inch-pounds on a 25 volt DC system (80-75 amp). 10% rated static load is 77,000 inch-pounds. Weight is 25 1/2 lbs. Design incorporates auxiliary power take-off and end-pointing and stops.

Type D-625 Double motor power unit for horizontal stabilizer of transport aircraft. Consists of small 1/15th h.p. continuous duty motor operating through a gear reduction for braking in automatic flight, and a large subminiature duty 2 1/2 h.p. motor with direct drive of 12,000 R.P.M. for manual operation. Dimensions of complete unit are 12 1/2" x 7" x 3 1/2". Weight is 10A lbs.

TYPE D-625

Type D-236 A rotary actuator for intermittent duty, delivering 200 inch-pounds at 107 R.P.M. on 24 volts DC. Unit includes magnetic clutch and brake, adjustable limit switch, cam, and thermal protection. Gear ratio is 25 to 1. Weight is 8 1/2 lbs.

How to double the efficiency of your service organization without cost

When engine builders or air frame manufacturers specify Bendix® for their fuel metering, landing gear or brake requirements, they are assured not only of the finest quality products but have at their command one of the best trained and efficient service organizations to be found in the aircraft industry.

Every member of the Bendix Products service staff has been thoroughly schooled in the latest methods of efficient maintenance procedures and is trained to work with customers from maintenance to ultimate replacement. Thus, the original quality and performance built into every Bendix product is delivered at all times.

Like all members of the Bendix Products

organization, the service staff is made up of men who are specialists in the fields of fuel metering, landing gear, wheel and brake equipment. Having met and answered service troubles for all types of planes and operating conditions, these service specialists can help successfully in building good will for engine builders and air frame manufacturers that preventive maintenance that will assure lower operating costs. Any way you look at it, for the best in research, engineering, manufacturing or service in the fields of fuel metering, landing gear and brakes, it pays to make on a specialist—and the Bendix Products service organization has been a specialist in these fields for over thirty years.

Now it's your turn.

INTERFEROGRAM of flow in shock tube shows complex adding set up by shock wave passing over double-wedge initial section. Flow is from left to right.

Shock Tube Used as Windtunnel

The use of a shock tube as a short duration windtunnel to study blast effects on aircraft makes up part of Project Lucas, a study conducted by the Dept. of Aeronautical Engineering, Massachusetts Institute of Technology. Until now the shock tube is used to study the mechanics of shock waves, but Prof. R. L. Bagnold and H. G. Stiver believe that the MIT unit may be the only one in the country with the "weathered" feature.

The shock tube can simulate transonic flows, usually at speeds up to a Mach number of about 1.5, which includes the critical transition region. This is in addition to its primary use as a source of high-velocity shock waves for the purpose of studying blast effects.

► **Dimensions**—The MIT shock tube is about 95 ft. long and one foot square,

made of 1/2-in. steel plate. The tube is divided into two sections by a diaphragm.

One end of the shock tube is ported, the other end can be pumped out to nearly vacuum to increase the pressure ratio across the tube. A remote-control knife punctures the film and the shock forms when the flow starts down the tube.

Duration of steady state flow over the model is only about 0.040 sec., long enough to reveal a series of electrically timed high-speed pictures to be taken at the flow.

Project Lucas, financed by the Air Research and Development Command, USAF, is a study to determine the effects of blasts on flap assembly, and to find out how close to a launch bay a plane can fly without structural damage.

"Sky Compass" for Polar Navigation

A new "Sky Compass" for accurate north-south or polar regions above 70 deg. latitude has been developed by the Kolbenan Instrument Corp.

The Elmhurst, N. Y., manufacturer says the Sky Compass determines an aircraft's true heading by finding the position of the sun when it is below the horizon. It does this by using the polar star light in the sky when the sun is not visible. This is particularly important in the far north and south regions because of the persistent twilight periods when the sun is below the horizon.

Twilight sky cameras project and chart normally used as visual references in celestial navigation.

The Sky Compass includes a specially designed optical system which incorporates an eyepiece. This component includes a polarizing plate and a half-wave plate. The latter has cut-outs to produce a pattern visible in the optical field. The instrument also has an illuminated bubble and a true heading indicator.

The compass is designed in design, very similar in appearance to the periscope instrument which Kolbenan has produced for naval uses for the world's armies and the military.

Advantage of the periscope design is

7 reasons why Pacific Accelerometers

are the first choice of careful engineers

These 7 advantages design Pacific Accelerometers offer

- 1 Accuracy in recording with close, theory limits
- 2 Long life, designed for 1200 hour continuous use
- 3 Excellent repeatability and zero free performance
- 4 Minimum sensitivity to cross talk
- 5 Unique internal design combined with sealed case
- 6 Built for meeting requirements of customer companies and for central systems
- 7 Proven designed and well designed in a standard pilot and case in designs

ARCTIC NAVIGATION AID tells direction by pulsation of one's light

But only a very small part of the instrument protrudes into the streamer, causing particularly no additional drag. Kolbenen says. Also, the danger of blown-out streamers is avoided, it is claimed.

To operate, the navigator rotates the Six Compass as he looks through the eyepiece. The light intensity in the various portions of the picture in the streamer varies with the Six Compass is pointed towards the sun's zenith. When this happens, the picture disappears and the optical field becomes a solid gray—no confusion known as the "white point." Then the navigator reads the results by looking from the scale.

Kolbenen says that at advantage of the Six Compass is that the angular picture bubble always and true heading with, as all visible in the optical field. This enables the navigator to check all three measurements and get the true heading quickly and accurately.

Hiller Erects Barrier For Jet Test Stand

The jet engine wheel-test stand at Hiller Helicopters, Palo Alto, Calif., is divided with a large round barrier and auxiliary streamer to maintain a low noise level during test runs.

Standing about 16 ft high and with a diameter of about 40 ft., the revolved structure was designed by Hiller's industrial engineering personnel in conjunction with Owen Corning's, Fiber Glass Division sound control experts. It was constructed by Aco & Glumac.

Lower half of the wall is composed of two wood sides with 5 ft. of air fill between. Upper portion of the barrier, also a double wall, has a Fiberglas blanket as the insulating material.

Because of the technical problem

SOUND BARRIER for Hiller test stand.

concerned with the noise of an far the jets, it was not feasible to build a completely enclosed circular barrier, it is pointed, hence the barrier was partitioned to provide shielding for the pipe brick area, with the open end pointed toward San Francisco Bay.

THRUST & DRAG

Eighty books from the "Reading List for Young Engineers" have been placed for loan to the headquarters of all engineering society activity in the Cincinnati area. This is a part of a pilot study program to determine what aspects of community life can be of assistance to young engineers during the first few years following graduation.

The books cover almost any subject in the arts and humanities, they include Balzac's "Doré Stories" and Merri's "Capitol" and "Venus's "Ten Stories." This is a commendable step in the physical education of an engineer and it has only one disturbing aspect: the fact that it was necessary in the first place.

Why should an engineer have to be taught to improve his humanistic background? Why must a committee have to recommend the books he should read? Why have the engineering schools almost the best in completely in teaching more than engineering?

McDonnell Aircraft Corp's John H. Mervin, chief of research, airplane branch, said this about weight saving at the recent summer meeting of the Institute of the Aeronautical Sciences:

"At McDonnell we have come to the conclusion that weight saving is quite important to fighter airplanes, and have established a criterion for its importance as follows:

(a) In engineering, we can spend up to 30 man-hours design time to save a pound in a given design, all other things being equal.

(b) In manufacturing, we can spend up to 10 man-hours per pound for each airplane, all other things being equal."

Let's assume for obvious a dog-eared old cliché from the engineering profession: Let's sell Tappan down the river.

For years, you and I have been hearing it, speaker say that time is money. "Fast growth, like Tappan." At that point, word association takes over and for the next few seconds I see the of plantation and the so flies and hear the falling bloodhounds. By the time I shake off the magical spell, the speaker has gone on and is winking up for the finale. I've named the in-between.

There are all sorts of better—more colorful—phrases to describe the random growth of engineering organizations, and I for one would like to hear them, instead of the bloodhounds and the clanking wire.

AVIATION WEEK

presents the

AUGUST 16, 1954

THE

WORKING WITH the editorial cooperation of the USAF Air Materiel Command, Aviation Week's editors are preparing their most important publishing assignment of the year . . . the August 16 Air Materiel Command Edition. Editorial offices at Wright-Patterson Air Force Base, Dayton, Ohio are buzzing with activity as teams of Aviation Week editors collect the latest available information and data on 1955 Air Force Procurement and weave together the complete story of this major Air Force Command.

KEY EDITORIAL EFFORT is being concentrated on covering new policies and ground rules of AIAA and its revised relations with the aircraft industry... spelling out new regulations and complete information on how to best do business with the government. Other editorial sections will be devoted to Air Force industrial mobilization plans, space provisioning policy, and industry's new

complete story of AIR FORCE PROCUREMENT

AIR MATERIEL COMMAND EDITION

role in Maintenance and overhaul programs. Research and Development procurement will be featured in a special report.

COMPLETE DETAILS on Fiscal 1955's Air Force Procurement Program as well as complete Command organization data and buying information will establish the unmatched usefulness of this Air Materiel Command edition in the Aviation Industry, the Air Force and the Government. In addition, this issue will provide a valuable tool in the government's everlasting search for new sources of manufactured products, materials and services.

CURRENTLY, AMC holds over \$16 billion in contracts awarded. More than 14,000 different firms are AMC prime contractors, and AMC inventories list more than 1,250,000 separate items. Approximately 100,000 AMC employees represent this huge

business volume, with civilian employment far outnumbering military. AMC spends more dollars annually than General Motors, Standard Oil of New Jersey, American Telephone and Telegraph, Ford, Bethlehem Steel, General Electric, Union Carbide, Chrysler, Westinghouse, U. S. Steel and duPont combined . . . provides aircraft and equipment maintenance on a scale ten times larger than all domestic airlines combined.

MORE THAN 50,000 ENGINEERS, aviation management men, Air Force, Military and Government Officials will have a copy of this issue on August 16, 1954. Make sure your company is represented in the Air Material Command Edition. Write—or wire—your advertising recreation to:

New UHF Transceiver Ideas Pay Off

• AF finds maintenance problems reduced by field test of pilot quantities, simplified design.

By Philip Klein

Durham-based support on Air Force's new UHF transceiver, the AN/ARC 34, indicates that pre-production field testing of pilot quantities, use of unified construction, and building sub-assembly provisions have paid off in reduced maintenance time, cost, and loss still required of GI maintenance personnel.

USAF's experience shows "Convent (conventional) maintenance is a pain in the neck, who normally check, plug and burn, could do the most better reduce maintenance time (the ARC-34) and, in some areas with a little help, the very highest reduction of maintenance," displays the fact that the ARC-34 was new and untested equipment. That was reported by C. H. Scher, a branch chief in the Wright Air Development Center's Communications & Navigation Lab, to the recent airborne electronics meeting at Dayton.

Developed by RCA—the new ARC 34 developed by Radio Corp. of America, is a 1,750-channel, remotely controlled, constant communication set covering the 225 to 400-mc band. Any 20 of its 1,750 frequencies can be preset and selected in flight from a single knob. The set weighs 55 lb (including remote tuning control), and occupies a volume of one cubic foot. That is approximately 40% lighter and 50% smaller than previous UHF transceivers, Scher says.

The older Collins AN/ARC 17 UHF transceiver, developed by the Navy and used until recently by both services is mounted in a personnel container for high-altitude operation. That requires some size and weight penalty. The ARC-34, while not personnel, one delivers full power up to 50,000 ft, RCA says.

How It Was Achieved—The notable second of the ARC-34, Scher said, is the result of a new production philosophy and true engineering philosophies employed in its design.

Pre-production field test, real operational conditions of pilot quantities built with production looking.

Unified construction throughout, with each subassembly designed to perform replacement without any adjustment and without requiring overall

recalibration and without requiring overall replacement.

Field testing problems, including a simple "go/no-go" tester which can be plugged in to locate faulty subassembly.

Most Significant—Probably the most significant innovation was the decision to produce 150 pre-production ARC 34s with production looking prior to plugging into a full scale manufacturing program. The entire batch of ARC 34s was installed on jet fighters at a single station air base where WADC and RCA engineers could keep close watch on performance and shortcomings.

This controlled field test was the first of its kind ever attempted by the CAN lab and some possible have been the test ever attempted by any WADC lab, Scher told Armstrong-Wright. This experiment "proved that there is no substitute for proving out a new equipment in the environment in which it will be used, by many different pilots, in many systems," Scher said.

Design Changes—RCA's development samples, which are subjected to extensive bench and flight testing, are seldom put like the article which will be produced in quantity. Scher pointed out. Design changes suggested by field or manufacturing experience are difficult to introduce if full-scale production is underway, involving extensive built-in modification program and disrupting manufacturing operations.

The ARC 34 controlled field test "has proven its value in terms of the design changes which have resulted to date," Scher said. "Some actually would have required much more time and effort. Others required improved manufacturing methods and techniques. All of them will represent very significant savings to the military service and, above that, cost of the first production," Scher added.

This has prompted other WADC labs to follow suit in new complex equipment which they are studying for production. Scher said. He believes the technique should be employed whenever the time schedule will permit it.

Added Unification—He also took full advantage of unified construction, not in itself new, the CAN lab imposed some added requirements on the ARC 34. Each main assembly had to be designed so it could be placed in a replacement cabinet without any adjustment, and the should not affect component performance at all. For instance, each intermediate frequency amplifier stage is a completely self-contained, pre-tested, plug-in unit, eliminating alignment problems.

Each major assembly had to be as replaceable as a screwdriver. Components and mechanical couplings had

to be designed so as not to require any special positioning, other than to engage them.

Final Insulation—RCA designed each major subassembly so that a tester could be plugged in to the space checking of critical voltages and currents, selected by the rotary switch on the tester. Listing values for each check are posted on a chart in the tester cover. As a result, "a person with practically no training can immediately determine the faulty subassembly," Scher said.

One result of unified construction, accessibility of individual components, is assurance by parts catalog which RCA supplies. These allow technicians to be pulled out, set electrically connected to the main design and operated for high-precision troubleshooting.

Answer to Growing Complexity—Scher is hopeful that the approach used in the ARC-34 program is at least a partial answer to the problem of growing complexity in military communications equipment. One example of the growing complexity—World War II AN/ARC34 communications set had only 10 channels, ARC-34 has 1,750, which requires complex frequency synthesizer circuitry.

The greater the complexity, the higher the skill required by maintenance men, the greater the cost of maintenance training, and the fewer the qualified personnel available to do the maintenance, is the way Scher sees up the problem.

Maintenance costs have reached the point, Scher said, where the military spends eight to 10 times the original cost of an equipment to keep it operating during its lifetime.

New USAF Standard—The ARC-34 is slated to become the standard UHF equipment on all new USAF aircraft, and may be used to replace the ARC-37 on existing fighters and interceptors where space and weight are a critical problem.

Following are a few of the technical highlights of the ARC-34, based on data released by RCA:

- Channel spacing: 100 kc.
- Channel stability: 10 lb.
- Power output: 5 watts minimum.
- Approximate range: Up to 250 miles air-to-ground up to 500 miles when used airborne.
- Receiver sensitivity: 5 microvolts or better with 80-dB signal-to-noise ratio.
- Approximate range: Up to 250 miles air-to-ground up to 500 miles when used airborne.
- Channel selection time: No more than 4 sec.

The ARC-34 has a separate guard channel for transmission and reception of emergency messages. Guard channel receiver has its own RF and IF sections, but shares the audio amplifier of the main receiver.

NEW 1,750 CHANNEL UHF TRANSCEIVER developed by RCA, to be standard equipment on all new USAF aircraft, is 40% lighter, 50% smaller than predecessor.

UNITIZED CONSTRUCTION employed throughout the ARC-34 permits substantially replacement without having to disassemble, using only a screwdriver.

FAULT-FINDING TESTER ISOLATES TROUBLE by major subassembly by providing convenient means of measuring significant voltage and currents.

AIRCRAFT TOOLING

Hecker has been designing and building tools for the aircraft industry since 1921, specializing in jigs, fixtures, inspection tables and master tooling. We offer a complete service from tool design through tool building to finished production parts off the one plant. We write your inspection and will be pleased to send further information.

TOMORROW'S AIRCRAFT: *One step closer*

**Air Arm Systems
"package engineered"
for installation
and maintenance**

Quicker installation and easier maintenance . . . important plus-factors for airborne electronics equipment are a reality at Air Arm. The basic Air Arm approach to all electronic problems, combined with inherent ingenuity and capability, has led to concepts such as pellet packaging, microsealed and functional circuitry, built-in test points . . . to mention just a few.

Applying these concepts to all Air Arm systems gives outstanding features . . .

- 100% accessibility
- compatibility with aerodynamic design
- weight and space reduction
- self-contained shock isolation
- simplified software design and construction

Microamps, joined wires and other proven developments for weight and size reduction are a basic part of the new packaging concepts. Electronic circuits are physically combined and integrated into compact subassemblies—each of which has a single major function. Thus, over-all packages are made up of functional units of complete systems.

The "package-engineering" results from intense Air Arm development and close Air Arm cooperation with the special problems of airborne design and operational requirements. Such achievements in electronic-mechanical design are typical of Air Arm's efforts to bring simplicity and increased reliability into airborne systems, thus bringing tomorrow's aircraft—One Step Closer. Westinghouse Electric Corporation, 3 Gateway Center, P. O. Box 946, Pittsburgh 30, Pennsylvania 20100

Microamps apply the "package engineering" which Air Arm applies to airborne systems. Simple and reliable in iron and copper, they are a rugged replacement for vacuum tubes. Whenever such packaging is used, maintenance is reduced, circuitry is simplified and systems are far more dependable.

The most advanced state-of-the-art is always brought to bear in Westinghouse design, evaluation and construction of airborne systems. For example, human engineering studies help technicians perform tasks quickly, simply and safely—thus building the unseen amount of dependability into the system.

Makers Report New Measurement Devices

A new vacuum tube voltmeter, range of 10 cps to 100, is one of several recently measured voltage and phase measuring devices available for laboratory use. The new Model 4802 can measure voltages of 0.1 u.v. to 500 v. in 20 selective ranges, is reportedly accurate to within 2% up to 1 sec. Input impedance is 10 megohms. Manufacturer is Hewlett Packard Co., Dept. P, 365 Page Mill Road, Palo Alto, Calif. Other new measurement devices:

- Low frequency phase meter, covering range of 0.0001 cps to 1,000 cps, and reportedly measure phase between two voltages to within 1.5 degrees, gives a digital type readout on a digital counter. Manufacturer: Advance Electronics Co., 451 Highland Ave., Passaic, N.J.
- Vacuum-tube electrometer, Model 759, a d.c. voltmeter with input impedance greater than 99 Ω , and current below 10 μ A, and drift within 10 nA/year, according to Keithley Instruments Co. Line has five voltage ranges from 0.3 to 2, 5, 20, and 50 volts, refers policy. New meter also can function as a d.c. potentiometer for members and coefficients with quoted frequency re-

sponse of 0 to 5,000 cps. Company address: 3908 Granville Ave., Cleveland 15, Ohio.

- Phase meter, Type 512 A, measures phase angle to within one degree, at changes in phase angle to within 0.1% over frequency range of 20 to 20,000 cps, or to 1 cps, with slightly higher cost. Input signal range is 2.5 v. Manufacturer: Instrument Corp., Astoria, Mass.

Avionic Literature

Recently announced bulletins and data sheets disclosing devices and techniques of interest to persons in the avionic field include:

Dielectric Jacket

The transformer is made with Silastic 8305, new solvent evaporating material. Designed for gross impedance. Since 1967 especially has been the desired conductivity of conventional insulators or rubber dielectrics, according to Dow Corning Corp. Transformers coated with Silastic 8305 meet pressure resistance and low impedance durability specs of MIL-137, Grade 3. It meets 2-4 hours at 200C.

1965 FILTER CENTER

• **New Pioneer Autopilot for TC-115**—Eclipse Filters' new TC-115 autopilot is advanced design for lightest airframe. Approved by FAA. Dealer: Electronics Co. 400 W. 34th St. Philadelphia 19, Pa.

• **New Pioneer Autopilot for TC-115**—Eclipse Filters' new TC-115 autopilot is advanced design for lightest airframe. Approved by FAA. Dealer: Electronics Co. 400 W. 34th St. Philadelphia 19, Pa.

• **New Civic Proven Get-Sensor**—Civic reports that its new FAR (passive and active) gear has successfully substituted a Rotolink K100, 3 input circuit in IV Stage, Civil. New Air Mobile Test Center. Sensors are at (airfield) the test to prove detection in some quarters about the new device, which consists of a set gear and a rotating magnet. (Aviation Week Dec. 14, 1963, p. 71)

• **Zeroing Aircraft Change**—A system for maintaining zero (or an arbitrary value) electronic change on an aircraft in flight has been developed and tested by General Research Lab, under contract to Air Force Cambridge Research Center. The system, described by CAL's Frank M. Polan at the recent Dayton research conference, consists of two electronic field sensing elements on the wing tips, a discharge point in the tail and a variable high relay supply to activate discharge.

Tiny Transformers

They transformers for transformer cores, encapsulated in epoxy, are available in five types: input, output, autotrans, or chokes. rated from under one milliwatt to over 300 watt. All under one inch for operation at temperatures from -50C to 100C. Manufacturer: A. T. Electronics Inc., 6090 Lemmon Ave., Dallas 10, Tex.

• **New Master Beam Report**—Missouri Performance Straddle (for) Airborne Radar Master. Approved: Zepherus Corporation 735 N. 1st St. for the sale of new report in Radio Technical Commission for Aeronautics Special Committee No. 18. Identified in Paper 77-14 (DO-17), report can be obtained for a cost from RTCA Secretariat, 1714 "P" St. N.W., Washington 25, D.C.

• **Rose Active in Avionics**—Growing activity of Rose Avionics Co. in the avionics field is shown in company's report that it is manufacturing limited quantities of an airborne augmented data for Navy and in developing new avionics for USMC. Rose also notes the current equipment for its Probe target drone and recently obtained a BuA contract to develop an airborne helicopter hovering device. (Aviation Week June 7, p. 7)

• **Canadian Get ECM**—In our article, "Transport Copies New Nav Aids" (July 12, p. 45), readers' general response to the "Nav" being a surprise, calling it appear that GCA equipped with NTL has difficulty "seeing" a hovering helicopter. The reverse is true, of course, as the equipment filter out ground clutter and picks up the target's rotating blades. —FR

'Flying Showcase' Sells Bendix Products

REFURBISHED DOUGLAS DC-3 in flight demonstrates the Bendix Aviation products.

DISPLAY COUNTERS behind seats are 13 ft. long. Power outlets are provided so exhibitors can be operated wherever feasible. Products are changed for specific audiences.

Miami—On a flight down here from Terrebee, Bendix Aviation Corp. showed this writer an "Flying Showcase," an ex UAL DC-3 that the company used to display its airborne wares.

The Bendix KDR-1 airborne radar was in full operation during the flight. The thunderstorm forecast for the Jacksonville, Fla., area did not materialize, so there was no opportunity to demonstrate the equipment's weather warning ability. However, in its second job—terrain mapping—it did a fine job, showing rivers and coastline clearly on the long-range radar cathode ray tube. The KDR-1 antenna is mounted in the nose in a retractable position, optically opaque radome. It scans the area in front of the plane at a rate of 35 deg. The set incorporates three sweep ranges—25, 50 and 150 mi.

A hood that swings on the front of the scope protects it from bright sunlight. The scope is swing-mounted on a swivel so it can be turned aside for use in other parts the flight engineer or pilot desires.

A servo motor tilts the antenna through a range of plus 15 deg. to minus 15 deg. The antenna is shielded against pitch and roll of the aircraft to a maximum of 20 deg. Angular displacement information is taken from the plane's autopilot, or, when no autopilot is aboard, from a separate gyro.

Other equipment on display in the Flying Showcase:

•Crew-line computer, installed the evening before the flight. The latest-known new computer "takes an entire station list of one desired point in the map," say Eclipse-Pioneer personnel.

ANTENNA for KDR-1 antenna radar was installed by Remco-Walker employees.

DIAGRAM shows layout of DC-3 used to display products of various Bendix divisions.

AFT PASSENGER CABIN has 12 seats; demonstrates flight panel on stationed side.

KDR-1 AIRBORNE RADAR system indicator is mounted on swivel in Flying Showcase for use by either pilot or copilot. Radar indicator is located in passenger cabin.

Acceleration!

MEASURE IT WITH A GIANNINI ACCELEROMETER

Magnetically and mechanically damped units available. High outputs can be used to activate recording, indicating or time-measuring devices directly without amplification. Precise metal potentiometer coil and brushes used for long life and low noise. Conducted by attitude or by manual. Will operate under conditions of high vibration. Write for literature.

G. M. GIANNINI & CO., INC.

Airborne Instrument Division

PASADENA 1, CALIFORNIA

also developed it. When bearing information and distance, its destination that is called from an area DME station can set into the computer, it will establish the required track in the destination. The computer takes the new destination into a reference station and the bearing to the station can be read from the radio indicator indicator. Distance from the desired course can be read on the actual computer indicator or DME station. The computer is not set as production but is scheduled for early availability.

• **Remotely-controlled directional gyro indicator for aircraft:** Instrument incorporates the same low drift gyro

used in Bendix's Polar Path computer system. It is claimed to give bearing and azimuth readings the same accuracy as available only in navigation and commercial aviation equipment. The system uses an airborne system located on the gyro to drive the panel-mounted indicator. The indicator also receives an airborne signal, so it may drive and other instruments.

• **Remotely-controlled Fiberglass bottles for liquid oxygen:** such as Bendix is producing for the Republic F-105, Boeing B-47 and B-52, and Douglas B-66. The bottles contain liquid oxygen at -298°; the company points out that 1 or 2 in. of the liquid is equivalent to

550 cu. in. of oxygen in the gaseous state.

- **FR-104 autopilot and automatic approach flight path control.**
- **Scatter system analyzer.**
- **Engine instrument.**
- **Navigation and communications equipment.**
- **Overhaulable fault protection system.**
- **Compressor type fuel flow system.**
- **Shaw-Rohrer:** The forward section of the cabin contains two 15 ft. sections on which the products-water of three heated up-air displaced. This comes a bulkhead, all of which is a 12 sec. valve with a flight panel, so passengers can always perform.

—CLC

Trailer Classrooms Have Push-Out Walls

Now is using a fleet of novel mobile classrooms with walls that can be rolled out to expand from the 12 ft. x 12 ft. normal tunneling width of 8 ft. to form an area of a room 20 ft. square. Up to 40 students can be seated comfortably in the new tunneling classrooms. The units were designed and built by Technical Development Co., Inc., in New York City. The units are used to teach technical training advantages enjoyed previously only by large stations.

They are used to teach maintenance, electronic and mechanical systems of aviation. The courses cover administrative, aircraft parts and accessories, electronic electronics, fire control equipment, launch, releasing and handling of related equipment.

OFF THE LINE

Self-sealing, rupture drain plug recently made by Technical Development Co., Philadelphia, is now being handled

by Air Associates, Inc., as exclusive distributor. The plug has a spring-loaded poppet-type valve which seals off the pump when the plug is removed for inspection.

Lytle workshops of El Al, Israel National Airlines, will be taken over by Bickel Corp., a \$5 million venture capital firm owned partly by the Israeli government and a group of American

Wright Uses X-Ray for Alloy Studies

• Fluorescence technique slashes time needed for quality control analysis of aviation metals.

Carbide-Wright Corp. reports that chemical analysis of aviation alloys is accomplished much more rapidly by complementing the usual wet chemical methods with non-destructive, non-invasive techniques, such as X-ray fluorescence and optical spectroscopy.

A typical analysis of Nimonic 90 is now finished in 4 hr. instead of 19 hr.; Nimonic 80 is done in 4 hr. instead of 14. The saving arises from the application of X-ray fluorescence, C.W. points out.

Samples of several different alloys now are analyzed by the quality control lab using this method. Studies are being made to adapt more metal materials to the technique.

►How It Works—The X-ray fluorescence method involves bombarding a sample of metal with X-rays of such wave length that a fluorescent spectrum is emitted by the sample. Each wave length in the spectrum corresponds to an element in the sample; the intensity of each wave length is proportional to the amount of the element present in the alloy. Intensity is measured by Geiger counter.

Standard calibration curves are obtained by bombarding samples of known composition that cover the concentration ranges expected in the unknowns. By comparing the unknowns with standard curves, concentration may be determined with accuracy high enough for quality control purposes. C.W. finds that day-to-day reproducibility of results is good.

►Limitations—At the present time, C.W. analyzes only iron, chromium, and cobalt in its Nimonic 80 and 90 by means of X-ray fluorescence. One reason is that the technique is effective only with elements whose atomic number is above 22 and an excitation energy from 8.18% to 50%. Special helium chambers are necessary for analysis of elements whose atomic number is below 22, so optical spectroscopy is preferred in that range—the C.W. lab uses optics for its chromium and titanium. Chromium, molybdenum, silicon and sulfur are checked by wet chemical procedures, which are relatively simple and fast for these elements.

Carbide-Wright points out that

METAL SAMPLE is tested for X-ray fluorescence analysis of makeup at Carbide-Wright.

OPERATOR READS INTENSITY of emitted wave length on dial fed by Geiger counter.

Nimonic 80 and 90 are fairly complex alloys. As a result, their complete analysis encompasses three techniques of X-ray fluorescence, optical spectroscopy and wet chemistry. In the case of alloys where the X-ray technique could be used alone, the time saving afforded by the method would be especially striking, the company indicates.

The equipment shown in the pictures above is supplied by the General Electric Co. Carbide-Wright's quality control engineers point out another maker of X-ray fluorescence units is the North American Philips Co., located in Mt. Vernon, N. Y.

Meet the man who aids design engineers

...on bellows assembly design problems

Mr. D. D. Gordon of our engineering staff specializes in bellows applications.

It will help plan a bellows assembly to meet specific requirements wherever there's a design problem involving flexible connections, ranging from pressure vessels, etc.

We'll recommend the right bellows metal. We'll know the correct bellows design—volume, liquid or gas. We'll help you choose and make more intelligent choices in order your design plans more effective—your products better.

Alloys and design bellows assemblies are used in many applications—

from the automotive device, gas and vacuum, hydraulic mechanical equipment, pumps, as flexible connections and more uses. Let our bellows application engineers, our full-history of experience and ample production facilities work for you. You'll save time, trouble and money.

SEND FOR FREE BULLETIN
Max Reed Bulletin gives you the full story about metal bellows and bellows assemblies. Write for your free copy today. Ask for Catalog QM-1000.

OVERSEAS SPOTLIGHT

Japanese Buy 2 Marathons

LONDON

The Japanese bought two Eastern Airfrance, four delivery of the first of two new 20-passenger Harrier Page Marathons earlier this month at the French company's Reading plant. The second plane was expected to follow soon.

Fitted for JICA requirements, the four-engine transports are said to have a range of 1,570 mi at 165 mph. Passengers are do (hardwood) Copey Queen 70 lb, rated at 140 hp each. Gross weight is 18,150 lb.

Heron Feederliners to India

LONDON

Indian Airfrance Corp. plans to buy eight do (do) Heron 2 feederliners soon, with the possibility of more later, the Times reports. The Heron 2 will cost 14.

In addition, the owner is looking at transports for its longer routes between more cities. Cessna will probably be chosen the Cessna or Vidium Viscount.

Corrosion Downed Viking

WASHINGTON

Corrosion-triggered fatigue cracks led to fracture of a vital bolt hole in the wing of a Central African Airways Viking transport resulting in a crash that killed the eight passengers and crew of five Mar 24, 1957.

A government board of inquiry found that a sudden gust of wind struck the aircraft, causing a fracture of the fatigue-weakened lower starboard boom outboard, which was rapidly followed by complete disintegration of the Viking transport.

Corrosion must be attributed mainly to the fact that the steel bolt was not cadmium plated, the board stated.

Naturally, Reds Have More

LONDON

Length of Russia's internal air routes exceed that of the U. S., according to Air Marshal N. Shirok.

Flight magazine quotes a Moscow radio broadcast in which the Red air did also stated that during the last three years of World War II, the Red possessed 48,000 planes a year.

The statistic also noted a few more claims of Russian firms first however than in flight (Moscow, 1957), first outside loop (Moscow, 1957), first jet flight (Moscow, 1957), first jet flight (Moscow, 1957), first jet flight (Moscow, 1957), first jet flight (Moscow, 1957).

TEST ANY MAGNETO

R-985 to R-4360...hi- or lo-tension

Here's savings spelled out in dollars! Here's one test stand that will replace a whole

shop full of miscellaneous magneto test units. In pairs or singly, you can test any magneto regardless of size...test any magneto whether high tension or low tension!

Finger-tip controls... handy work table area... amazing freedom from vibration...

PAC's famous built-to-take-it easy maintenance construction! Modernize with a TE 6037 Hi-Lo Tension Magneto Test Stand now! You'll speed up every magneto job, you'll save money and valuable shop space, too!

AMP is first, as in its tradition, to bring **Automation** to aircraft wiring. For AMP **Automatic Wire Terminators** are in production, day in, day out, in most of the leading aircraft companies in the U. S. and Canada. These AMP **Automators**, more than any other single factor, have made pre-wiring methods possible for aircraft. With application speeds ranging in thousands per hour per machine for complete, unscheduled, terminations, AMP **Automatic Wire Terminators** are leading the attack against wiring bottlenecks.

If you are interested in pre-wiring systems, the latest solderless terminal developments for aircraft, or are curious about automatic termination methods, AMP will send trained survey engineers and demonstration teams to your plant.

FILTER ELEMENT in porous stainless.

Stainless Filter Element Permits 600°F Operation

Porous stainless steel elements in 316 for airborne hydraulic service can be used in operations at over 600°F.

Made of Type 316 stainless, these elements are available in various particulates in 1, 1 1/2, 2 or 2 1/2 inches size. They are used to produce low pressure drop and have long service life. They are easily cleaned in the field for reuse.

Filters are presently available in housing 0.5, 1, 6 and 12 gpm, and are used to be considerably smaller than equivalent AN-6115 units.

Aircraft Porous Metals, Inc., Glen Cove, N. Y.

MAGNET used with hot-lead track.

Small Electromagnets Speed Material Handling

A line of small electromagnets for use with mobile materials handling systems has been announced by the Electric Controller & Manufacturing Co. The magnets can be operated with compressed air or electrical current and are used in applications can be attached to lift trucks.

The magnets are furnished in sizes ranging from 125 to 350 lb. in diameter weighing from 155 to 1900 lb. The 600 lb., 24 in. diameter magnet will lift

a 6,000 lb. block of slab, the 1,300 lb., 24 in. magnet will lift a 15,000 lb. 24 in. magnet will lift a 13,000 lb. block of slab.

All of the magnets in the series feature bottom plates welded in place. Continuous welds between the inner and outer circumference of the bottom plate and the magnet case are used to provide a water-tight seal. Single-conductor, rubber armored cables are brought out of the bottom plates through compression glands and are connected to the magnet case by a strain clamp.

Electric Controller & Manufacturing Co., 2785 E. 79th St., Cleveland 4.

MULTI-STEP blocks and bars used.

Aluminum Setup Blocks Prevent Table Nicking

Multi-step setup blocks of aluminum alloy that will withstand great weight under clamping pressure have been developed by Jorgens Tool Specialty Co.

The manufacturers report these blocks are machine setup time cut, because of their relative softness, protect expensive machine tables from scratches and nicks. The blocks hold work from 0 to 3 in. They can be mounted on 1 in. high ribs and purchased from 0 to any desired height. The units are packaged in sets of four-to-two multi-step blocks and two ribs. Jorgens Tool Specialty Co., 712 E. 16th St., Cleveland 19.

Precision Instrument Dials Now Precision-Made

A new method of manufacturing dials for precision instruments is used to reduce possibility of error, according to its developer, Precision Photo-mechanical Corp.

In the manufacture of dished circles or dials, there are three prime sources of error, IPC states:

- Non-uniformity of spacing
- Non-uniformity of line widths
- Eccentricity between center of gravitation and center of rotation

The new process, utilizing an optical mechanical scanning instrument, is said

FROM ^{THE} **Verson** ^{NAME} A COMPLETE RANGE OF HYDRAULIC PRESSES

1200 ton straight side

750 ton port type

400 ton double action

400 ton straightening press

300 ton beam press

200 ton bending press

Write for our copy of the new Verson Hydraulic Press Catalog which explains detailed data on the entire Verson Hydraulic line.

A Verson Press for every job from 50 tons up.

In the Verson line of hydraulic presses, there is a size and type to meet virtually every need from 75 tons up. In addition to the more common types illustrated above, Verson also manufactures such special models as gap type presses, ballbreakers, hobbing presses, rubber pad curing presses and pipe forming presses. If there is a question as to whether a mechanical type or a hydraulic type is best for your job, Verson, as a leading manufacturer of both types, is able to make unbiased recommendations.

Whatever your press problem, bring it to Verson and take advantage of our extensive know-how and experience.

Ideally suited for
processes requiring
heating --

Fluid heat-up and isomerization
characteristics make the
THERMAL DF Heat
Exchanger particularly
valuable for the wide range
of needs of oil refineries,
petrochemicals, pulp and
paper mills, etc. Convection, not
radiation, is the predominant
mode of heat transfer.
Wide temperature changes
can be met in minutes,
not hours.

to eliminate heat loss from the hot two
sides and greatly reduce wear from
the third. With the process, dual
graduations can be made of any width
ranging as fine as three divisions (300/120
in) up to any size desired to meet con-
struction requirements.

The master dial is graduated on a
glass plate that is ground optically flat
before it is made light sensitive. Its
dimensional stability becomes that of
glass. Photographically reproduced
copies are made by contact printing
under vacuum and dual blanks printed
from the master using a master table of
the same tolerance as the hole in the
graduated master. Along the center
table is a reference in machining opera-
tions against absolute concentricity of
the graduations with inner and outer
diameters.

ALSO ON THE MARKET

Airplane landing lamp with new fil-
ament base is said to provide longer,
more uniform, longer life, more stable
beam pattern, lower maintenance costs,
greater assurance of safety than its
predecessor. Named GE 5199, lamp is
rated at 600 w., price is \$18.75 plus
tax—General Electric, Lamp Division,
Nela Park, Cleveland 12.

One-piece self locking locknut made of
high tensile aluminum meets all ex-
isting tensile requirements for steel
nuts but is 65% lighter. Made of
2457 aluminum, the nut may be used
on steel bolts and studs where time
pressure do not exceed 2500 F. The new
105 ES Flodex nut comes in five sizes
5-11, 10-12, 1-18, and 1-24—Stratford
Fastened Steel Co., Jenkintown, Pa.

Self-releasing collet with cloveleaf
grip for use on holes, roller formers,
etc., are said to have "live" action
which enables release of collet and work
piece. Wiping action between collet and
clamping sleeve eliminates accumulation
of chips or dirt between the two—Ragot
Products, Muskegon, I. I., N. Y.

Moly-Spec-Kote lubricant is spread on
metal surfaces from pressurized aerosol
containers. It is non-inflammable and
may be applied to hot surfaces. It is
non-corrosive and non-toxic, does not
contain ozone breeder. It dries quickly,
forming tenacious, long-lasting film.
Moly-Spec-Kote is for hot bearing
operations, for valves, gears, tie-rod
joints, power screws and reciprocating
parts in general—Alpha Corp., 170
Hudson Ave., Greenwich, Conn.

TITANIUM and the F-102

From nose to tail, REM-CRU titanium plays
an important part in the production of the
Convair F-102... just as it does in all ad-
vanced-type aircraft.

For REM-CRU titanium's high strength-to-
weight ratio, corrosion resistance and com-
plete freedom from stress-corrosion cracking
make it an essential material for high perfor-
mance. In the F-102, commercially pure tita-
nium is used for fuselage skin sections, shrouds,
bracing and self-ventilating ducts, and wing lead-
ing edge ribs. REM-CRU titanium alloy
grades C-110M and C-100M are used exten-
sively for primary structural fuselage frames

and wing spar fittings.

REM-CRU, leading producer of titanium,
has expanded its facilities to provide fast de-
livery of sheet, strip, plate, bars, wire, tubing
and forgings... in a wide variety of sizes,
shapes and grades—including new high-
strength and weldable alloys.

Let our experienced engineering staff—
backed by extensive test data—help you make
the most of titanium in your application.

To keep abreast of the latest developments in this
vital metal, write for the *Titanium Review*—a free
periodical devoted to the application and fabrica-
tion of titanium alloys.

WHAT'S NEW

Scare Movie

The air transport industry has a public relations problem on its hands with *The High and the Mighty*, Warner Brothers' screen adaptation of Fricot Gane's best-selling story of a landing where flight from Honolulu to San Francisco.

Movie critics have seen the film, seized it, and set the tone for public reaction. The majority rate it among the top pictures of the year for dramatic presentation, but about a third then cite its possible adverse effects upon the mind of the air traveler and the potential for trouble.

Typical is Otto L. Guenther, Jr., of the New York Herald Tribune. He opens his review with this impressive appraisal: "You may decide never to step into an airplane again after seeing *The High and the Mighty*."

Several online officials frankly admit that the picture could have adverse effects. "The book was designed enough," one says, "but a motion picture with a top rating will be seen by a large segment of the population. It could make bad!"

To those in the industry, the story is loaded with too many improbabilities to be taken seriously. But there is a good chance that the widespread reaction will react to Warner's attempt at shock tactics and take it very seriously.

Two series of highly improbable events could well lead such a person to the conclusion never to fly again. • On page three, because John Warner, just prior to taking from Honolulu, vividly recalls his landing crash of a few years ago. His confidence in shaken Reinholdt comes from a small boy showing a map of the island.

• Pilot Sullivan (Robert Stack), with two minutes' hours of solo flying behind

FOR HIGH ENVIRONMENTAL TEMPERATURES
NEW ADEL Jet Engine Accessory

One of a series of compact, rugged, lightweight valves specially designed and produced for jet engine auxiliary control systems.

OPERATION

- A Spring Offset, Two Position, Solenoid Operated, Fuel Valve using engine oil to operate hydraulic cylinders.
- B Solenoid energized, 3000 psi at inlet port produces outflow at cylinder 1—cylinder 2 open to return.
- C Solenoid de-energized, produces outflow at cylinder port 2, cylinder 1 open to return.

CHARACTERISTICS

- 1 Ambient temperature range—40° to +135°F.
- 2 Operating pressure 3000 psi.
- 3 Ports per ADEL10050 are available in 1/4", 5/16", 3/8", and 1/2" tube sizes.
- 4 No packing on sliding members.
- 5 Operating voltage 18-30 VDC.
- 6 Current required 10 amp. at 30 volts.
- 7 Continuous duty selected.
- 8 Fuel valve spring loaded against pressure to 4000 psi max.
- 9 Operating fluid MIL-L-7808.
- 10 Non interference type valve.
- 11 Weight 1.75 lbs.

ADEL provides a complete line of Aircraft Hydraulic & Pneumatic Controls, Equipment, Hydraulics, Aerial-Airport & Fuel System Equipment, Engine Accessories and Line Supports.

ken, observed with the idea that the flight is all laid before it over leaves the ground. As the flight progresses, his subconscious becomes more active. When the cabin starts to jolt, he perceives:

- The first engine plane loses a propeller. Propeller regains a wing blade, coming away lost of fuel. Engine is left hanging from axle.
- One they still under San Francisco on the moment of fuel running with three engines, an oil then, he forced to divert? The supposedly experienced navigator gets jumpy, goes way off on his calculations by figuring static rules instead of mental rules. (Biting nails, nervous.)
- Passengers are given instructions and prepared for ditching.
- Meanwhile is shown sitting at rear of cabin.
- Navigator repeats his component, bites another bit and concludes that they could make the coast if they can pick up 11 extra minutes of fuel.
- Master takes place in the cockpit, talks to pilot temporarily taking command. Pilot has given up, looks that all is lost and wants to ditch immediately. Captain says has around, takes over, begins cutting down as never to see last. Captain says in the cockpit for several moments.
- Pilot, after some time, "comes to his senses." He then agrees that they have a slim chance of making it and reserves command.
- Aircraft makes desperate approach into San Francisco, flying dangerously low, making perfect landing with 30 gal of fuel to spare.

Telling the Market

American Chemical Paint Co.'s check list of metal protective and paint treating chemicals and products has been put up as a new revised format. Write company at Ambler, Pa. . . A new 28-page catalog (No. 1798) on the reinforced steel bar all girding steels has been published by Hovson Co., Waukegan, Ill. . . A complete brochure set of Civil Air Regulations and the Civil Aeronautics Manual is sold on a subscription basis by Ruler Service Co., 728 Jackson Pl., N.W., Washington, with information brought up to date two weeks after changes are made.

Crop and Snow-Rougher Trench Apparatus, a four-page brochure on the choice used in testing special alloy steel used in high temperature service is published by Ladagap Corp., 1521 Cicero Ave., Chicago 41. . . "Photo-Fluor," a 16-page booklet, covers a method of applying this coating of tungsten carbide on metal parts. Write Ladco Air Products Co., 39 E. 42nd St., New York 17.

THERE GOES THAT PASSENGER...

Since he came back from Europe he's been a man to watch. Over these leading airlines are operating the Viscount and setting up new records for passenger preference—and profits! That passenger loved flying by Viscount was something really new! Certainly it was the most comfortable flight he had ever made. Certainly it was the quietest. Certainly he noticed hardly any vibrations—and these four turboprop engines inspired a feeling of real confidence. Watch that passenger. . . Back in the United States he still flies—and smiles—and looks forward to the day when he can fly by Viscount again. This may be sooner than he once thought. For among the airlines that have already ordered Viscounts are Capital Airlines, Trans-Canada Air Lines and British West Indian Airways.

FORECAST INTO FACT

An airplane predicted years things for the turboprop Viscount. Here is what it has achieved—or yet:

- Earned more than \$1,000,000 profit for British Overseas Airways in six months.
- Doubled RCA's share of traffic on important routes.
- Cut heavy-duty flight schedules.
- Won new orders from airlines in both hemispheres—including TWA and KLM.

hydraulics engineers

Requires a expanding Aeronautical Engineer has several openings for qualified men in the field of automatic hydraulic equipment. If you are interested in a permanent position in the advanced control field with America's largest aircraft manufacturers, consider these challenging opportunities now available at top salaries.

Mechanical Design Engineer—Hydraulics

New position open in the design of precision hydraulic servos, valve reduction and other hydraulic systems as applied to jet engine control systems. Requires BSE degree or equivalent. No previous design with hydraulics or reduced cost of production especially pertinent.

Production Engineer—Hydraulics

New production engineering position open working on problems at immediate term, possibly one year or two in precision hydraulic systems including fuel injection, servos, valves, actuators. Requires BSE degree or equivalent and minimum of 4 years' experience in maintenance of hydraulic systems. Ability to interpret production requirements for design engineers especially valuable.

Hydraulic Design Engineer

New opportunity to design of hydraulic components and systems involving servos, valves, actuators for automatic flight controls. Requires engineering degree or equivalent and 3 years' design experience. Ability to lead others in creative projects desired.

Hydraulic Research Engineer

Desired early career position in research involving studies in control valve mechanisms, automatic phenomena in hydraulic systems, fluid and fluid communication and related subjects. Also will act as consultant to engineering department. Requires BSE degree or equivalent with background in advanced testing in hydraulic control systems.

THE CONVAIR CHALLENGE TO ENGINEERS OF EXCEPTIONAL ABILITY

Beyond the eleven feet this Convair in the Ohio offers you a way of being judged by men in the world's best from the viewpoint of worth, heavy and increasing requirements, the Convair Engineering Department offers you challenges never in the past.

It is, we believe, the "engineer's" engineering department—increasing, energetic, imaginative—with the director who makes security for capable personnel.

At first, consider this: Convair developed and flew the world's first turbo-prop engine, first delta-wing airplane, first delta-wing engine—engineered and built the world's largest airplane, the world's largest gas turbine engine.

Or this: Convair's F-35 is the world's largest operational fighter. Convair's B-1 is the world's largest bomber. Convair's XF-101 holds the world's record for the turbo-prop engine.

Or this: Convair has been awarded the world's first production missile contract and the first production contract for the supersonic transport.

Convair... Convair has the greatest diversity of overall engineering projects in the company, including high-performance fighters, heavy bombers, large flying boats, transports, missiles, engine systems and guided missiles.

Convair... Convair has a completely integrated development process, from concept to design to development to production to service.

Would you like to join us? We recently made engineers of proven ability—men who were in our field at the time, their minds, their skills and abilities solving the complex problems confronting us in our programs. If you are such a man, write us and we will send you a letter booklet about us, plus other restraining material so help you make the decision.

Write: H. T. BROOKS, Engineering Personnel

CAL-Pioneer Merger Approval Expected

- Purchase proposal wins CAB examiner's nod.
- But Continental-Braniff combine is ruled out.

Merger of Continental and Pioneer Airlines appears certain following a recommendation by Thomas E. Wrenn, Civil Aeronautics Board examiner, that CAB approve the proposal.

If approved by the Board, the merger would be the first instance in which a trunkline purchased an operating local service airline, Wrenn says.

At the same time, Wrenn ruled out a Continental-Braniff Airways merger, reorganization of which had been considered by the Board and consolidated with the CAL-PAL case.

CAB ordered a Braniff-CAL merger investigation in one the recent "disputed" disapproval of the reorganization agreement between Continental and Pioneer so that it would be in a position to determine if a BNC Continental merger would be in the public interest.

• **Beneficial Savings**—Wrenn approved the CAL-PAL merger because:

• Integration of the two systems will result in substantial savings in aggregate need for mail gear at the two airlines.

• Routes will integrate interbranch links in operational standpoint.

• Competitive inter-branch of the two will not be altered materially.

• It will provide improvement in service to the public.

• It is consistent with Air Coordinating Committee's policy report to the President.

• It is consistent with the policy of the Board to maintain adequate local service.

• Merger Plan—Continental and Pioneer merged last December (Aircraft Week Dec. 25, 1955, p. 69) to the following merger plan:

• Continental would pay Pioneer its net book value in cash at the time of the purchase plus 65,000 shares of CAL stock valued at \$6 a share. Total purchase price would be paid partly by Continental's assumption of certain of Pioneer's liabilities.

• Routes of the two airlines would be combined and all general aviation, P.M. service, Route 1, South and West divisions, William F. Long would join CAL's board of directors, increasing its number from 11 to 13.

• CAL would return Pioneer officers

CONTINENTAL-PIONEER ROUTES now total 3,167 mi. plus at eight common points.

Harling L. Lowrey, Harold R. Bennett and E. W. Baker.

• P.M. stockholders would retain their shares in the separate Pioneer Aircraft Services, a corporation formed to dispose of P.M.'s Martin 202 equipment retained from scheduled service when CAL agreed to increase schedules to operate the aircraft.

The contract is subject to approval of the Board, stockholders of both airlines, Chase National Bank of New York, custodian of both carriers, and First National Bank of Dallas, custodian of Pioneer.

• **Low Salary**—In their joint application of merger, both airlines estimate their integration for the 12 months ending June 30, 1956, would result in \$373,194 less bank-over, need and \$916,018 less mail pay.

CAL leaders estimated the merger would reduce their bank-over need approximately \$397,000 from the 1955 level. He did not estimate the reduc-

tion in mail pay that would follow the \$397,000 bank-over saving "since this would require a detailed consideration of the difficulties that may be met in a future rate proceeding," Wrenn reports.

"However," he adds, "because material is at all the options that the enhanced \$397,000 reduction in bank-over need would provide the basis for a substantial reduction in the already mail pay required by the two carriers."

• **Route Advantages**—As to integration of services, Wrenn finds:

"The Continental and Pioneer routes are placed at eight common points, four at which (Omaha, Tex., Albuquerque, N. M., Lubbock, and Midland-Odessa, Tex.) are major agricultural centers for both carriers. The Pioneer system fits into the Continental system with three of the Pioneer stations specifically in operation by both carriers at the center of Pioneer's system."

and operational importance of these common status present control advantages from the viewpoint of conducting operations over the two sections by facilitating the routing of aircraft and the coordination of departing flights.

Review of eight mergers, acquisitions and consolidations involving domestic airlines approved by the Board, shows only one instance (the Russell-Mat Continental merger) in which the number of common airlines equaled the number of common ports in the Russell-Mat Continental system.

The CAL-PAL integration will provide expanded service to 30 cities in Texas, New Mexico and Oklahoma, he reports. Based on proposed schedules, the combination carrier will offer "first class one-carrier service to 25 pairs of cities between which 5,516 passengers traveled in 1953."

Among the principal beneficiaries of new through-plane service would be Austin-El Paso, Tex., Russell N. M., and Corbair, N. M., and El Paso-El Paso, Tex., Corbair and Texas and Texas and Texas. The New Mexico carrier also would be given one-way, one-plane service to Houston—then principal port.

► **AA Consolidation**—"The record clearly demonstrates that the proposed acquisition will not materially alter the route structure in the area, create a monopoly or jeopardize other carriers," according to Wynn. "Integration of Continental and Pioneer will eliminate competition in only four markets, none of which average more than three passengers per day."

"It would provide a multi-stop competitive service in that of America in the El Paso-Dallas City World market where there is an average of 40 passengers per day and would establish competition in America's San Antonio-Austin and Lubbock and Austin-Dallas and Colorado Springs markets. The traffic in each of these particular markets averaged less than four passengers per day."

► **BNE-CAL Reorg**—Discussing the Eastern Continental merger possibility, Wynn held that:

• Such a merger substantially would reduce the bank-note need and total need per mile although not enough to render either airline subsidy-free. Bureau record estimated that traffic accounts ranging from the combined operations and the savings effected through elimination of duplicate costs at common stations would reduce bank-note need by \$1,616,000. No estimate was made of reduction in total mail per mile.

• Headquarters need savings do not include any consideration of cuts that might result in the integrated carrier for adversely affected employees.

► **Boeing's estimate** of a reduction in scheduled mail pay of \$660,421 would not be a net saving to the taxpayer since other airlines would suffer losses equivalent to traffic to the integrated routes.

It is possible, he says, to arrive at a free estimate of the degree that would result from "there is no integrated schedule pattern in the second space which the other carriers could produce their carriers."

► **Attitude of the parties** toward an integration prevents a merger now. Continental is opposed to integration at the present time, "Boeing says that it has some merit and is willing to negotiate, but the testimony of Boeing's president could hardly be described as enthusiastically supporting such an integration," Wynn reports.

"Moreover, the record shows that Boeing has some financial problems which might have considerable influence on the ability of the parties to agree on the terms and nature of payment to the selling carrier," he says. Wynn concludes that if the two airlines could agree on terms, there is nothing in such a transaction that "would be inconsistent with and adverse to the public interest."

Combination 377s

Pen American World Airways is negotiating its entry from Pacific fleet of 17 Boeing 377s to combine with another first class configuration, being

the change in the success of the 377's operating since Apr. 1 as PAN's San Francisco-Moscow route.

Continuation of a sixth transport this month permitted extension of the service to Tokyo this month. Los Angeles-Tokyo flights will start Aug. 1. Continuation of the entire fleet will cost approximately \$1.7 million.

U.S. Airliners Battle Viscounts in Australia

(McGraw-Hill World News)

Melbourne-Australia's domestic airlines are plying U.S. air-powered transports against British Viscounts in an advertising and public relations battle for increased traffic.

Jetset Airways is lowering the tariffs of two Convair 340s on routes, Australian National Airways is placing its Super Constellation 440s scheduled for delivery in the first part of 1954, and Trans-Australia Airlines is using Viscounts based on experience of early delivery of its Viscounts.

Australia's 37-passenger 340s, after ships to the airline's biplane fleet 240s, will be combined with special equipment and lower fares than those charged by ANA and TAA.

Industry observers have judged that Australian National and Trans-Australia will not be able to meet the lower rates because of the cost of new equipment plus wage savings demanded by pilots.

Gadget 'Squeezes' Turbo Compound Into DC-4

Engineers at United Air Lines' San Francisco "pink bar" have been designing a 1,000-hp steel engine stand to hold Wright R3350 Turbo Compound engines into the DC-4's landing gear. But attachable

engines and extra parts built into the corner of the new stand allow the device to be lowered for loading. Then raised once it is ready for rolling into position. Clearance at the top is less than six inches. Stand built by Trans Metal & Mfg. Co., Dallas.

U.S. Studies Middle East Airlines

FOA aviation consultants preparing recommendations to bolster West defenses on Iran-Curtain borders.

By Richard Bismarie

Development of local Middle East airlines to assist in closing the gap to the West's defense planning bordering Russia and Red China is being studied by a four-man consulting team of aviation experts working for Foreign Consultant Administration.

Headed by Allen F. Bismarie, director of flight training for United States Army and former president and general manager of Lockheed Aircraft Maintenance Co., UAL's Moroccan subsidiary, the consultants will provide FOA with recommendations on how to develop primarily the small Middle Eastern airlines in coming form.

- Technical assistance
- Financial aid
- Military security

As directed by FOA, the report prepared in a part of Secretary of State John F. Kennedy's program to end off the nearly 1,000 mi. of unguarded territory between Turkey and Pakistan through which the Russians possibly could send the West.

- Turkmenistan
- Iran
- Suez Canal Zone
- U.S. Persian Gulf interests

- Pakistan's interests at Dacca, Lahore and Karachi
- Imported part of Pakistan's capital, Karachi

It is the Secretary of State's plan to provide these Middle Eastern countries including Iraq, Iran and Afghanistan—with technical aid to bolster their defenses and make them strong individually and collectively to guard the Middle Eastern Coast. The word emphasis is on being self-reliant.

Senate Majority Leader William F. Knowland has said this year might well become Secretary Defense' "military stroke in progress."

• **Airline Role-Limited** and often primitive military and highway facilities in the countries concerned have provided evidence a complete scale in recent years is suffering the ravages of the population. Now that their surface is vital to the maintenance of peace within the free world every effort is being made to strengthen their countries internally.

That's where the local airlines come into the picture.

"One purpose is to build up their local carriers," says Bismarie, "for it has been realized that in order to contain communism we must also build up the standard of living of the people."

• **On the Spot-Bismarie's** advisory team is working closely with the consultants. No funds have been made available for operations. Their work will result only in recommendations to FOA.

• **Topic to the Middle East** will be made eventually, Bismarie says, in order to obtain the proper information of the foreign airlines concerned. Countries with "most pressing" problems will get first attention.

Effort will be made, he says, to recommend measures that can pay for themselves or be self-supporting in a reasonable period of time. In some cases, U.S. airlines may be called upon to supply financial and advisory aid to the Middle Eastern airlines.

• **CAA Role-Such** action would be similar to Trans World Airlines' move in Ethiopia several years ago when TWA began operations in Ethiopia as a part of Secretary of State John F. Kennedy's program to end off the nearly 1,000 mi. of unguarded territory between Turkey and Pakistan through which the Russians possibly could send the West.

• **Civil Aviation Administration** will be consulted in the country and its program since CAA has established and operates aviation facilities throughout the Middle East.

"Any government agency whose services may be useful in development of the airlines," Bismarie says, "will be considered in our recommendations."

A team of CAA international experts stationed abroad in this form as a cooperation team of the Middle East for FOA. The program was set up in 1957. Among their recommendations was the recommendation of David Horne Yoffin (DHV), international Turkish airline.

• **Major Middle East** aviation advisory team will deal directly with the Middle East at the present time but before long their activity may be extended to other parts of the globe where the Middle East situation exists. The program is concerned only with the airline as part of local transportation, Bismarie says.

Bismarie, a retired rear admiral of the Naval Reserve, was selected to head the consulting team by W. A. Pritz, U.S. UAL president, whose Pantheon was asked for assistance by Harold Stassen, Foreign Operations Administrator. FOA sent an airline expert whose company had no interests in the Middle East.

• **Arriving Bismarie** says, "George R. Cope, former vice president of American Airlines in Mexico" • **John F. Williams**, retirement formerly employed by Latin to Mexico.

• **Byron F. Shattell**, former chief pilot for Government National Airways during the Korean conflict and assistant pilot for Cline Airways and Pan American World Airways.

Airline Policies Must Lure Investor: Murray

Air transport industry can be industry-free and self-reliant only if it is a position to attract the confidence and support of private investors, Robert Murray, Commerce Undersecretary for Transportation, believes.

"Whether the industry itself can do the policies of government have been successful," says Murray, "until there can be shown a solid record of private investment, the interest of the private investor."

• **"Something Wrong"**—"Unhappy," the word in the aviation industry has much more to it than it appears to be. "We must look at the fact that in general, the man with a dollar to invest does not yet regard the air transport industry as a particularly desirable place for his money."

• **He** is in the aviation industry, that is something wrong. The great problem before us is the immediate future is to make sure that the policies of private management and the policies of government will generate enough earnings to win the respect of private capital."

• **Policy Framework-Murray** spoke before the annual aviation operations conference at Boardman, N.J., a meeting in explanation of the Air Coordinating Committee's air transport policies (40) under the AOC charter.

The committee's report was accepted recently by President Eisenhower as a "guide to the future consideration of questions related to the subject of civil aviation and is making appropriate recommendations to Congress."

• **The report** concludes a framework of federal aviation policy which is entirely related to the growing maturity of this industry—a policy which will enable the industry to develop fully the type of aircraft operation in the public interest," Murray explains.

• **Self-Sufficiency Potential**—With respect to domestic air transport operations, Murray states, AOC has concluded that the industry now is in a position where self-sufficiency can be taken to move in a satisfactory fashion toward a self-reliant status.

"We are convinced that there is now within the domestic air transport system a basic pattern for sustained self-sufficiency, provided that necessary adjustments are made in some situations and in the industry's organization," he says.

Murray believes the goal of self-

26-Cent Mail Rate

Postmaster-Bus Airline has won a three-year rate and contract from Post Office Department with its offer to transport mail at about half the cost and the "Big Four" centers.

The contract will be given to the center as a reward on shipments of mail—no direct subsidy—about \$100 million.

This is a two-mile rate of 26 cents, compared with the lowest scheduled carrier mail rate, that of the "Big Four," of 45 cents a local mile.

Efficiency can be achieved simply by prompt action by industry and government to effect route modifications, mergers and other adjustments. "In order to strengthen the industry and give it the fullest possible opportunity for achieving a reasonable schedule for self-sufficiency."

In explaining the lack of domestic route profitability, Murray notes that in 1952 there were some 50 airline pilots that operated an average of less than one passenger a day, and about 140 had less than three passengers each day.

Murray says some international routes will have to be maintained for local reasons of national interest. "It is the absence of any clear economic incentive for local routes," he says, "which has led to the elimination of any air service and economic development of services between U.S. flag carriers."

• **Subsidy Policy**—Continuing on the AOC policy toward unscheduled airlines, Murray says: "Our policies concluded that the general economic advantage of the Civil Aeronautics Act should not be used as the basis for any large-scale departure from the clearly intended requirement for the certification of common carrier services."

"And it goes without saying that these should not be delay in making the full use of the current unscheduled and unscheduled air service in these cases where existing authority has been exhausted."

• **Policy Dispute**—Meanwhile, AOC's report also contains the views of Democratic members of Civil Aeronautics Board, John Lee and Joseph Adams. Principal target of the criticism is the AOC policy on mergers of local service carriers.

Adams states, "In the absence of a careful consideration of all the public interest factors and not solely local—1 do not agree that our well-established local service system should be disrupted or eliminated by announcing that the fact of cost is to determine whether costs, costs, or other factors should be transferred from local service to the local service carrier, and that about each airline, such as local service to these cities, routes or local service will be eliminated."

Let either "I cannot subscribe to any statement of policy which, under the guise of effecting savings in subsidy, propose to eliminate the local service industry by preventing levels to check the route network of the local carrier."

Sen. John Kennedy, proposed Civil Bill costs of airline subsidies, passed the Post Office reform. "The Transportation Board Airline will be the best of less than half of the country's air traffic right now, a mere 10 percent of the total."

"To eliminate the example of economy set by this contract, it should be noted in comparison that local service or feeder airlines elsewhere in the country (and, indeed, in other parts of the world) have been able to operate at a level of 20 to 30 times their air traffic rates and, under the order of the Civil Aeronautics Board, not international airlines have been able to operate at a level of more than 10 times their flight rates."

be disrupted or eliminated by announcing that the fact of cost is to determine whether costs, costs, or other factors should be transferred from local service to the local service carrier, and that about each airline, such as local service to these cities, routes or local service will be eliminated."

Let either "I cannot subscribe to any statement of policy which, under the guise of effecting savings in subsidy, propose to eliminate the local service industry by preventing levels to check the route network of the local carrier."

"I, too, fear the reduction and elimination of subsidy but am unwilling to concede that the transfer to the hands of the local carrier would be in the long run made in any beneficial economic to the government. On the contrary, I fear that such we have shown during the past few years in developing areas but that the air transportation industry would be benefited."

GAA Changes Asked In Bill Amendment

Civil Aeronautics Administration should be established as an independent agency under the Department of Commerce to be a completely separate aviation bill.

It was offered by Sen. Harold Weller "to insure to complete independence the agency charged with the duty and responsibility of administering civil aviation law and policies with a minimum of congressional and legislative change."

The measure to which Weller alluded the aviation bill, known as "H.R. 1158" in the 1958 Civil Aeronautics Act with the effect that employees of certificated manufacturing and repair stations would not have to be certified individually.

To Engineers WHO WANT TO GROW

You can grow with Stratos—now developing new air conditioning systems, pneumatic power systems, controls and other pneumatic accessories for aircraft and industry. Positions are now being filled for—

RESEARCH ENGINEERS
For investigations and studies in pneumatic refrigeration and very high speed gas turbines.

PROJECT ENGINEERS
Several—International and Junior.

DESIGN ENGINEERS
Several and Junior.

Write to R. E. Pender, enclosing your qualifications for these interesting and challenging positions. Your correspondence will be kept in complete confidence, of course.

Excellent benefits available to you. Consistent to New York City 24-hour operation. Facilities. Free lunches—Fishing, Hunting, Golfing.

STRATOS
A Division of Raytheon Co. & Airplane Corporation
Rt. 1, Box 1, N. Y.
Manufacturers of air conditioning equipment and pneumatic accessories for high speed aircraft.

CAB ORDERS

(June 15/72)

DEFERRED

Transwestern Air Lines' exemption to operate a nonstop flight between New York and Detroit, Michigan, by making Cleveland the point of departure in the U.S.

Forest approval of exemption granted by Ford Pappas as president of both American Flyers Airlines Corp., an airline carrier, and American Flyers Int., to add this following flights to an interlocking airway: A. B. Quicker, vice president of

both companies and V. O. Gagnon, director of both companies

DEFERRED

Southeast & Western Airlines' application to operate two roundtrip flights between New York and Beirut, Lebanon, between June 26 and Oct. 17 by Lebanon permits.

Minutes of Delta CAB Air Lines, Minneapolis-St. Paul Metropolitan Airports Commission, cities of Minneapolis, Wis., and Rochester, Minn., and Kansas Airways Inc. included with the joint application at Northeast Orient and Eastern Air Lines for through plane service between Minneapolis-St. Paul and Miami via intermediate points.

Applications of Coast Lakes Airlines, Coast Air Transport and U.S. Airlines to carry letter-carrier and other preferred mail from Los Angeles to San Francisco.

Revised schedule of Delta CAB Air Lines, Minneapolis-St. Paul Metropolitan Airports Commission and Coast Lakes Airlines, Minneapolis-St. Paul, for flights between Minneapolis-St. Paul and San Francisco via intermediate points.

Oregon National Airways' application for an exemption from the tariff filing provisions of the Civil Aeronautics Act in order to engage in charter transportation as U.S. aircraft services without clearing tariffs on the route CAB.

APPROVED

Intercompany agreements between Delta CAB and Eastern Air Lines and Western Airlines on routes.

Southeast & Western Airlines' application to operate two roundtrip flights between Minneapolis-St. Paul and Beirut, Lebanon, between June 26 and Oct. 17.

GRANTED

Air Line Pilots Ass'n International, 1411 Market Ave. of Commerce, Capital, Delta CAB, National and British have to agree to the application of Northwest and Eastern to provide through-plane service between Minneapolis-St. Paul and Miami via intermediate points.

Western Air Lines have to intervene in Pacific Western Airlines' application to perform operations of a mail seasonal or scheduled route in a through aircraft over the U.S.

Minneapolis-St. Paul Metropolitan Airports Commission have to intervene in Eastern Northwest application for an interchange agreement.

American, Continental, Eastern, Delta CAB and Pioneer Air Lines, Air Line Pilot Ass'n, the Piedmont General and several cities and chambers of commerce permission to intervene in Trans Air Lines' application for service of a temporary certificate.

(June 21/72)

DEFERRED

Engine Airlines' application for permits of public passenger without permits.

Proposals of Delta CAB, Trans Air, Coast Lakes Airlines and Western Air Lines for their family plan fares.

APPROVED

Intercompany agreements between United Air Lines and West Coast Airlines and two other air carriers.

Agreement between various air carrier members of the Traffic Conference of America, Independent Military Air Transport Ass'n, and American Transport Ass'n for extension of military routes for transportation of military personnel for their own logistic support.

Southeast & Western Airlines' application to fly one roundtrip flight between New York and Beirut, Lebanon, according to New York, June 27 and returning on about Oct. 12.

GRANTED

National Airlines, Delta CAB, Air Lines

United Air Lines, American Airlines, West Air Lines, Capital Airlines, Eastern Air Lines, Continental Air Lines, Eastern World Airlines, Northwest Airlines, South Air Lines, Eastern Department, Society of American Pilots, Minneapolis-St. Paul Airport Commission, City of Columbus, O., Columbus Chamber of Commerce, communities of Knoxville, Tennessee at Anniston, Lenoireville and Johnson County Air Board and Lenoire County at Commerce, and Piedmont General permission to intervene in the scheduled certificate renewal case.

National Airlines to exempt until Nov. 5 to provide less transportation to a hotel and employ of Consolidated Military Aircraft Corp. and two from Douglas Aircraft Co. for the purpose of making technical flight observation of Gemini 104 and DC-7 aircraft.

Pioneer Air Lines a temporary exemption to serve Big Spring, Tex.

CERTIFIED

Proposed Star Route for transportation of mail to and from Los Angeles to Long Beach, Calif., and from Los Angeles to and from Los Angeles, Star and Providence Main.

ORDERED

Rebates contained in a contract of Capital Airways withdrawn from public display.

Pacific Northern Airlines to show cause why CAB should not fix its next rates.

EXTENDED

Pioneer Airlines Corp. exemption to operate charter trips for 90 days.

AMENDED

Consolidated Air Lines exemption by extending it by one year to carry national passenger at Port & Western Airlines, Hawaiian Islands, Hawaiian Airlines, Alaska Mail, Sperry Communications, Comair and Douglas Aircraft Co.

SHORTLINES

► **Confidential Air Lines** started new traffic route in June, flying 15,601 passengers 14,577,551 revenue passenger-miles. ... CAB earned 31% more mail during May than in the same month of 1955.

► **National Airlines** reports a 200% increase in miles of "penny bank" package vacations to Florida during the past year, an indication that summer travel to Florida may surpass NAA's winter business.

► **Northwest Orient Airlines** has demonstrated its scheduling base at Shemya Island, 35 mi. from the end of the Alaskan chain, and is operating its three-Pacific Boeing 747s (two) and DC-6s in and out of Thorsburgh Airport at Cold Bay, Alaska, 950 mi. east of Shemya on the tip of the Alaskan peninsula.

Rebuilding a new engine section to a cylinder, a highly specialized operation.

Factory Tools for Overhaul

ASSURE RESULTS OF
UNIFORM EXCELLENCE

Highly specialized work on Pratt & Whitney Aircraft engines, such as rebuilding a new crankcase section or rebuilding cylinders, must be done with special machine tools and factory methods. ... The tools and methods at the Airport Department are extensive that major parts replacement are as efficient as when new, and are properly installed.

News Sidelights

Local service workers have brought more members of Congress into CNA hearing rooms to support immediate renewal than asking people have seen in some time. There is a palpable opinion that the evidence of interest on Capitol Hill has turned the tide in the insurers' favor and that few companies will not have their rights restored. Some resist adamantly and suggest other than the Congressional Process deal (p. 36) are expected, however.

The Washington outlook for scheduled cargo carriers has not improved in recent weeks and there is increasing optimism in well-informed circles that future certificate awards in this category will be scarce.

As Coauthoring Cosponsors' Civil Air Policy Report said, it is one of the most sensitive subjects of controversy in Washington, although it has been relatively quiet since 1980. There still is a large number of indications in Democratic National Committee circles that Cosponsors' Department for Executive Administration should feel it has no policy power on CAA. The House Democrats contend, as a quasi-official agency, a member of Congress, and when Congress wishes CAA to change its ways Congress will change the Civil Airports Act.

The ACC's report is expected to have more effect on international trade cases than domestically, since such decisions must be cleared with the White House before they are entered and the President can order changes along the lines of Administration policy.

United Air Lines has released nine more DC-6s for conversion to aircraft services, made possible by additional deliveries of DC-7s. President Patterson says as of Apr. 30 United was operating 35% of its mileage in coach, against American's 18% and TWA's 48%. UAL will expand this figure to 37% in the next few months. Many of United's DC-6s are for sale, DC-7s will be used in coach work "as long as there's a demand for them," Patterson says.

Some of the highest Washington circles interested in aviation feel that there are too many airports in Alaska and further action over closing airports to cut the number of airports there should not be preempted.

Cities that have been granted *slowcoach* service by the scheduled carrier have generated bigger increases in first-class traffic than cities without scheduled tourist service, one economist study reveals. If true, this result would seem to give the lie to those who say that coach is diverting considerable first-class business.

A Boeing executive told a Los Angeles audience last week that the F-90 is "not in production yet."

First operational unit of F-100s activated will be at George AFB, Calif.

Helicopter shuttle service will be available between the Atomic Energy Commission's Oak Ridge, Tenn., facility and Knoxville Airport, by invitation on official business beginning Aug. 15. Using a Sikorsky H-19 (855) leased by USAF, the new AEC service will save about one hour in travel time between the two points. More than 1,000 passengers a month use Knoxville Airport on official AEC business.

More than 325 flights have been made by Allison Division's turboprop-powered Cessna 240, which has two 2,915-hp. T38s and Aeroproducts props. Recently, Assistant Secretary of the Air Force Roger Lewis and his guest flew in the turboprop 240 from Allison to St. Louis, the west stop of their nationwide tour.

Fronch recently got two new military planes off on test flight—a two-place Nord 3107 trainer and the M5s Halite 1521 which differs from the previous version in having lower landing gear with low-pressure tires and larger wing area. The Nord is a low-wing, fixed landing gear-type powered by a 170-hp. Sauerco engine weighing 2,000 lb. loaded. A second prototype, powered by a 160-hp. Astra engine, is expected to fly soon.

AVIATION CALENDAR

July 27-Aug. 1—U.S. National Sailing Conference, Elsinore, Calif.

Aug. 17—International Astronautical Congress, 1957, annual congress, Innsbruck, Austria.

Aug. 24—Experimental Aircraft Association, 44th annual National Air Pageant and National Air Show, Oshkosh, Wis., featuring "house" built aircraft, gliders, balloons, jets and antique, Milwaukee.

Aug. 9-10—American Society for Quality Engineering, 19th annual conference of American Technical Conference and first annual Western Regional Conference, U.S. Navy, Los Angeles, Calif.

Aug. 9-11—Institute of the Aeronautical Sciences, turbine-powered jet transport symposium, Seattle.

Aug. 10-12—American Aviation Education Association's symposium, College of San Mateo, San Mateo, Calif.

Aug. 10-12—National Electronic Show and Convention (NESC), sponsored by West Coast Electronics Mfr. Assn. and Institute of Radio Engineers, Ambassador Hotel, New York City.

Sept. 4-6—National Aircraft Show, Dayton, Ohio.

Sept. 12—Society of British Aircraft Manufacturers, 1956 Flying Display, Farnborough, England.

Sept. 13-16—Symposium on propulsion, electrical, and electronic systems, sponsored by National Bureau of Standards, General Radio Properties Laboratory, Boulder, Colo.

Sept. 14-16—International Instrument Congress and Exposition and third annual Analysis of Instrumentation, New York City.

Sept. 19-21—International Northwest Aircraft Council, 18th annual convention, Hotel Vancouver, Vancouver, B. C.

Sept. 20-22—International Association of Aeronautical Engineers and exhibition, Ballroom-Statland Hotel, Philadelphia, Pa.

Sept. 24-Oct. 1—Radio Technical Commission for Aeronautics, 5th assembly, Washington, D. C.

Oct. 1-3—Annual National Electronics Conference, Hotel Sherman, Chicago.

Oct. 5-7—Chambers Shop Ping Co., 14th annual Air Show, Long Beach, Calif.

Oct. 5-7—Aeronautical Society of America, 100th anniversary, Hotel Tokyo, Tokyo, Japan.

Oct. 5-6—Society of Automotive Engineers, National Aeronautics Meeting, Aeronautical Society and Aeronautical Engineering Display, Hotel Statler, Los Angeles, Calif.

Oct. 17-21—International Union of Aeronautical Sciences, annual general meeting, New York.

Oct. 15-22—National Safety Council, 41st annual National Safety Convention, Hotel Hamilton, Chicago.

Nov. 5-9—National Aviation Trades Association, annual convention and exhibit, Hilton Hotel, New York City.

Nov. 8-10—Air Industries & Transport Association of Canada, 50th annual meeting, Chateau Victoria, Vancouver, B. C.

Nov. 10-12—International Management Society, 18th National Tech and Management Show and Management Show, Harte-Hartman Hotel, New York City.

Nov. 12-14—Texas State Aviation Con-

Wipe Out the Blind Spots!

A kid stepped uninvited into a private plane at an important metropolitan airport, startled the entire cabin pattern for clearance and took off. Fortunately, he bopped safely over a congested building area before he crash-landed. No one died. After the act, the federal officers from Civil Aeronautics Administration moved in fast! It turned out the youthful pilot had no credentials, and never had presented any.

A pilot of a twin-engine charter carrier's transport started a takeoff at a New York airport with about 15 passengers one night not long ago. Something happened and the takeoff was aborted. A sharp turn kept the ship from rolling over the runway. Not many minutes later the pilot used it again, and there was trouble again. The right gear collapsed, his ship. The right brake caught fire and the plane wound up in an area that had been vacated a few minutes earlier by several gasoline trucks. The airport fire department extinguished the blaze and the pilot elected to try it again. This time he made it safe—out over the crowded residential district adjoining the airfield.

'After Hours'

In the meantime, an airport executive had been trying to locate a CAA inspector. It was "after hours," and the night before a holiday weekend. CAA men were exceedingly hard to find. One finally was contacted and the incident was reported in the hope that the pilot at least would be met in Chicago and convinced to make a full report on the matter—if he got that far.

These incidents are not at unusual in some of us in aviation would like. And if either plane had plowed into streets, houses, apartments or stores with loss of life to citizens, do you think the public would have understood why either of these men was permitted to take off?

Aviation has grown at a phenomenal rate. There are bound to be blind spots technically, operationally, legally, procedurally. There also are blind spots in our thinking. We are so accustomed to the status quo that we sometimes appear incapable of detecting these blind spots, or realizing the potential penalties we run into if we fail to correct them.

We should be searching for these blind spots every hour of every day, and taking prompt remedial action when we find them.

Encouraging as our progress in safety has been in many respects, there still appears to be a singular lack of interest in some of these blind spots—an inexcusable lack of awareness of the dangers involved.

Remember Public Opinion

Newark Airport was forced to close down for weeks because of an outburst public opinion following three air crashes in that populated vicinity. Such a hostile atmosphere never had occurred before in aviation history.

But the precedent has been set and who would be

brave enough to deny that it can happen again in the same congested area or another?

One of these important blind spots is the complete lack of an official screening of new airline pilots before takeoff! Airline pilots are supervised carefully. But at most fields there is little done to prevent anyone pilot or not, from entering the first plane he can, calling for clearance, and starting a takeoff. A tower seldom denies takeoff approval for reasons other than traffic, order or order.

The public has a right to legal and adequate protection from irresponsible actions of those who fly. On the basis, provision is there for enforcement. But enforcement of these types of restrictions is seldom punitive. It usually follows completion of the violation of someone remains alive to be punished.

Who and what agencies are set up to make an effort to keep the irresponsible or unqualified pilot from taking off on what is obviously foolhardy or dangerous flight? Certainly, no flight system would prevent all accidents, but some screening system would be far superior to none at all, and the well-publicized knowledge that a federal officer was on duty at every visible airport even knew of the 26 would in itself be a deterrent to foolish attempts.

A Dangerous Gap

There is a dangerous gap between the official administration of responsibility of airport management on one hand and those of the government on the other, and this gap needs closing.

There was no one at the airport that night to check in the charter pilot before he boarded his transport for his three takeoffs for Chicago. Was he a licensed pilot and was he carrying the necessary endorsements? Was the certificate his own? Was it risk in effect? Did it permit him to operate this class of aircraft? No one knew before he took off. You can report that situation hundreds of times a day in this country at busy commercial airports for most non-airline flights. Yet we take it for granted. It is time to change our mind-set attitude.

Civil Aeronautics Administration inspectors, the public's protectors, are stationed at most major airports. But for only eight hours a day, from 8:30 to 5, with a half hour off for lunch, 40 hours a week. They are off duty on Saturdays and Sundays. Why shouldn't our indignant citizens take a dam view of such a setup—unless all aviation was closed down at 5 p.m. each day, and all day Saturdays and Sundays.

When lack of public protection is it that permits any Tom, Dick and Harry to board any plane he can get into, at virtually any civil airport in the country and with the use of the paper bit of white paper take off without the slightest difficulty?

We in aviation need to grow in social awareness to the point where we become afraid at the chances we have been taking. We should become exceedingly jealous of the importance of our role in protecting the public, as the ground as in the air. —Robert H. Wood

from helicopters
to helmets...

Harvey
aluminum extrusions will cut your costs

Whether your application calls for an extrusion small enough for the nose of a safety helmet or rugged enough for the main structural member of a helicopter, you can be sure your requirements will be filled to your complete satisfaction at Harvey Aluminum. For more than 40 years we have devoted ourselves to our customers' difficult product design problems. As a result we've built a reputation for keeping a high percentage of their toughest projects to completion. If you need help in product design, engineering or fabrication matters involving wrought aluminum alloys, get in touch with a Harvey field engineer today.

MARKING THE MODE OF ALUMINUM... FOR EVERYONE

HARVEY
Aluminum

HARVEY ALUMINUM SALES, INC.
PASADENA—LOS ANGELES, CALIFORNIA
BRANCH OFFICES IN PRINCIPAL CITIES

An independent facility producing special extrusions, pressure die-casting, forging steel, rolling impact steels, aluminum stress member products and related mill products.

The men of Harvey Aluminum are dedicated to the idea of servicing your product with nothing more than And extrusions, we pump the delight to your place.

THE AIRFRAME'S THE SAME —THE POWER'S TURBO-PROP

Here is the Convair YC-131C Military Transport, a conversion to Allison Turbo-Prop power of the Model 340 Convair-Liner. Modified under an Air Force contract, the YC-131C is now flying powered by two Allison YT56 Turbo-Prop engines driving Aeroproducts propellers.

With this installation the Air Force is leading the way in testing the practical operating usefulness of Turbo-Prop engines—paving the way for the change from reciprocating to Turbo-Prop engines in transport and logistic aircraft.

Allison Turbo-Prop design and performance characteristics can help today's transports meet tomorrow's advanced operational requirements of:

- Increased Payloads • Higher Cruising Speeds
- Lower Fuel Cost • Less Maintenance Time and Cost

- Shorter Take-offs and Landings • Greater Passenger Comfort • Reduced Ground Handling Time
- Reduced Crew Fatigue

Since December 1950, Allison has conducted extensive flight tests with its own Turbo-Liner to exploit the advantages inherent in Turbo-Prop power for transport service. In addition, the Navy is accumulating experience in the Douglas A2D Skyshark and the Convair R3Y Tradewind—also powered by Allison Turbo-Prop engines driving Aeroproducts propellers.

Today that pioneering is paying off in the availability of Turbo-Prop engines and propellers which will enable military and commercial aircraft to carry bigger payloads, farther, faster and more economically.
